CAUTION: Before servicing this chassis, it is important that the service technician read the "Product Safety Notices" in this service manual.

SAFETY NOTICE

USE ISOLATION TRANSFORMER WHEN SERVICING

Components having special safety characteristics are identified by a  on the parts list in this Service Data and its supplements and bulletins. Before servicing the chassis, it is important that the service technician read and follow the "Safety Precautions" and "Product Safety Notices" in this Service Manual.

SPECIFICATIONS AND PARTS ARE SUBJECT TO CHANGE FOR IMPROVEMENT

SAFETY PRECAUTIONS

NOTICE: Comply with all cautions and safety-related notes located on or inside the cabinet and on the chassis or picture tube.

WARNING: Since the chassis of this receiver is connected to one side of the AC power supply during operation, whenever the receiver is plugged in, service should not be attempted by anyone unfamiliar with the precautions necessary when working on this type of receiver.

The following precautions should be observed:

1. Do not install, remove, or handle the picture tube in any manner unless shatterproof goggles are worn. People not so equipped should be kept away from the picture tube while handling.
2. When service is required, an isolation transformer should be inserted between power line and the receiver before any service is performed on a "HOT" chassis receiver.
3. When replacing a chassis in the receiver, all the protective devices must be put back in place, such as barriers, nonmetallic knobs, adjustment and compartment cover-shields, isolation resistors, capacitors, etc.
4. When service is required, observe the original lead dress in the high voltage circuitry area.
5. Always use the manufacturer's replacement components. Critical components as indicated on the circuit diagram should not be replaced by another manufacturer's. Furthermore, where a short circuit has occurred, replace those components that indicate evidence of overheating.
6. Before returning a serviced receiver to the customer, the service technician must thoroughly test the unit to be certain that it is completely safe to operate without danger of electrical shock, and be sure that no protective device built into the receiver by the manufacturer has become defective, or inadvertently defeated during servicing.

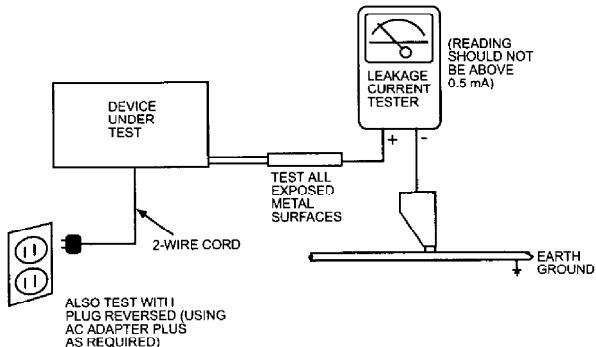

Therefore, the following checks should be performed for the continued protection of the customer and service technician.

Leakage Current Cold Check

With the AC plug removed from the 120V AC 60Hz source, place a jumper across the two plug prongs. Using an insulation tester (DC500V), connect one lead to the jumpered AC plug and touch the other lead to each exposed metal part (antennas, screwheads, metal overlays, control shafts, etc.), particularly any exposed metal part having a return path to the chassis should have a minimum resistor reading of $0.24\text{M}\Omega$ and a maximum resistor reading of $12\text{M}\Omega$. Any resistance value below or above this range indicates an abnormality which requires corrective action. An exposed metal part having a return path to the chassis will indicate an open circuit.

Leakage Current Hot Check

Plug the AC line cord directly into a 120V AC 60Hz outlet (do not use an isolated transformer for this check). Turn the AC power ON. Using a Leakage Current Tester (Simpson's Model 229 or equivalent), measure for current from all exposed metal parts of the cabinet (antennas, screwheads, overlays, control shafts, etc.) particularly any exposed metal part having a return path to the chassis or to a known earth ground (water pipe, conduit, etc.). Any current measured must not exceed 0.5 millamps.

AC LEAKAGE TEST

ANY MEASUREMENTS NOT WITHIN THE LIMITS OUTLINED ABOVE ARE INDICATIVE OF A POTENTIAL SHOCK HAZARD AND MUST BE CORRECTED BEFORE RETURNING THE RECEIVER TO THE CUSTOMER.

High Voltage

This receiver is provided with a hold down circuit for clearly indicating that voltage has increased in excess of a predetermined value. Comply with all notes described in this service manual regarding this hold down circuit when servicing, so that this hold down circuit is operated correctly.

Serviceman Warning

With minimum BRIGHTNESS and CONTRAST, the operating high voltage in this receiver is lower than 36.5kV. In case any component having influence on the high voltage is replaced, confirm that high voltage with minimum BRIGHTNESS and CONTRAST is lower than 36.5kV. To measure high voltage use a High Impedance High Voltage meter. Connect (-) to chassis earth and (+) to the CRT Anode button. (See the following connection diagram.)

Note: Turn power switch OFF without fail before the connection to the Anode button is made.

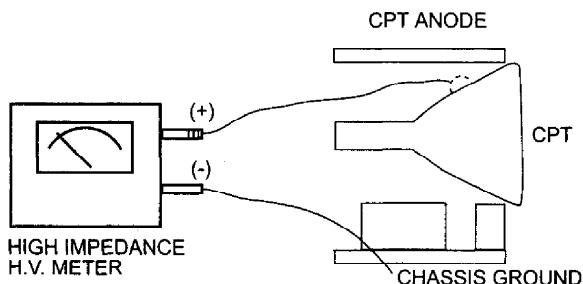

PRODUCT SAFETY NOTICE

Many electrical and mechanical parts in HITACHI television receivers have special safety-related characteristics. These are often not evident from visual inspection nor can the protection afforded by them necessarily be obtained by using replacement components rated for higher voltage, wattage, etc. Replacement parts which have these special safety characteristics are identified in this Service Manual.

Electrical components having such features are identified with an  mark in the schematics and parts list in this Service Manual.

The use of a substitute replacement component which does not have the same safety characteristics as the HITACHI-recommended replacement component, shown in the parts list in this Service Manual, may create shock, fire, X-radiation, or other hazards.

Production safety is continuously under review and new instructions are issued from time to time. For the latest information, always consult the current HITACHI Service Manual. A subscription to, or additional copies of HITACHI Service Manuals may be obtained at a nominal charge from HITACHI Sales Corporation.

X-Radiation

TUBE: The primary source of X-Radiation in this receiver is the picture tube. The tube utilized in this chassis is specially constructed to limit X-Radiation emissions. For continued X-Radiation protection, the replacement tube must be the same type as the original HITACHI-approved type.

When troubleshooting and making test measurements in a receiver with an excessive high voltage problem, avoid being unnecessarily close to the picture tube and the high voltage component.

Do not operate the chassis longer than is necessary to locate the cause of excessive voltage.

This Service Manual is intended for qualified service technicians; it is not meant for the casual do-it-yourselfer. Qualified technicians have the necessary test equipment and tools, and have been trained to properly and safely repair complex products such as those covered by this manual. Improperly per-

formed repairs can adversely affect the safety and reliability of the product and may void warranty. Consumers should not risk trying to do the necessary repairs and should refer to a qualified service technician.

WARNING

Lead in solder used in this product is listed by the California Health and Welfare agency as a known reproductive toxicant which may cause birth defects or other reproductive harm (California Health and Safety Code, Section 25249.5).

When servicing or handling circuit boards and other components which contain lead in solder, avoid unprotected skin contact with solder. Also, when soldering do not inhale any smoke or fumes produced.

SAFETY NOTICE USE ISOLATION TRANSFORMER WHEN SERVICING

Components having special safety characteristics identified by  on the parts list in this service manual and its supplements and bulletins. Before servicing this product, it is important that the service technician read and follow the "Safety Precautions" and the "Product Safety Notices" in this Service Manual.

For continued X-Radiation protection, replace picture tube with original type or HITACHI equivalent type.

POWER SOURCE

This television receiver is designed to operate on 120 Volts/60Hz, AC house current. Insert the power cord into a 120 Volts/60Hz outlet.

NEVER CONNECT THE TV TO OTHER THAN THE SPECIFIED VOLTAGE OR TO DIRECT CURRENT.

SERVICING PRECAUTIONS

CAUTION: Before servicing instruments covered by this service data and its supplements and addenda, read and follow the SAFETY PRECAUTIONS on page 3 of this publication.

NOTE: If unforeseen circumstances create conflict between the following servicing precautions and any of the safety precautions on page 3 of this publication, always follow the safety precautions.

Remember: Safety First.

General Servicing Guidelines

1. Always unplug the instrument AC power cord from the AC power source before:
 - a. Removing or reinstalling any component, circuit board, module, or any other instrument assembly.
 - b. Disconnecting or reconnecting any instrument electrical plug or other electrical connection.
 - c. Connecting a test substitute in parallel with an electrolytic capacitor in the instrument.
- CAUTION:** A wrong part substitution or incorrect polarity installation of electrolytic capacitors may result in an explosion hazard.
- d. Discharging the picture tube anode.
2. Test high voltage only by measuring it with an appropriate high voltage meter or other voltage measuring device (DVM, FETVOM, etc.) equipped with a suitable high voltage probe. Do not test high voltage by "drawing an arc."
3. Discharge the picture tube's anode by (a) first connecting one end of an insulated clip lead to the degaussing or kine aquadag grounding system shield at the point where the picture tube socket ground lead is connected, and then (b) touch the other end of the insulated clip lead to the picture tube high voltage output, using an insulated handle to avoid personal contact with high voltage.
4. Do not spray chemicals on or near this instrument or any of its assemblies.
5. Unless specified otherwise in these service data, clean electrical contacts by applying the following mixture to the contacts with a pipe cleaner, cotton-tipped stick or comparable nonabrasive applicator: 10% (by volume) Acetone and 90% (by volume) isopropyl alcohol (90%-99% strength).
CAUTION: This is a flammable mixture. Unless specified otherwise in these service data, lubrication of contacts is not required.
6. Do not defeat any plug/socket B+ voltage interlocks with which instruments covered by this service data might be equipped.
7. Do not apply AC power to this instrument and/or any of its electrical assemblies unless all solid-state device heat-sinks are correctly installed.
8. Always connect the test instrument ground lead to the appropriate instrument chassis ground before connecting the test instrument positive lead. Always remove the test instrument ground lead last.

9. Use with this instrument only the test fixtures specified in this service data.

CAUTION: Do not connect the test fixture ground strap to any heatsink in this instrument.

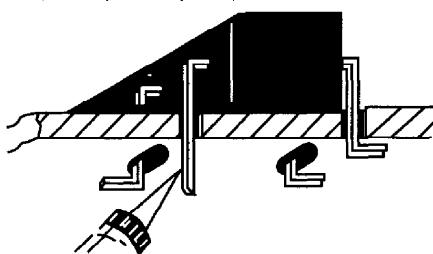

Electrostatically Sensitive (ES) Devices

Some semiconductor (solid state) devices can be damaged easily by static electricity. Such components commonly are called Electrostatically Sensitive (ES) Devices. Examples of typical ES devices are integrated circuits and some field-effect transistors and semiconductor "chip" components. The following techniques should be used to help reduce the incidence of component damage caused by static electricity.

1. Immediately before handling any semiconductor component or semiconductor-equipped assembly, drain off any electrostatic charge on your body by touching a known earth ground. Alternatively, obtain and wear a commercially available discharging wrist strap device, which should be removed for potential shock reasons prior to applying power to the unit under test.
2. After removing an electrical assembly equipped with ES devices, place the assembly on a conductive surface such as aluminum foil, to prevent electrostatic charge build-up or exposure of the assembly.
3. Use only a grounded-tip soldering iron to solder or desolder ES devices.
4. Use only an anti-static type solder removal device. Some solder removal devices not classified as "anti-static" can generate electrical charges sufficient to damage ES device.
5. Do not use freon-propelled chemicals. These can generate electrical charges sufficient to damage ES devices.
6. Do not remove a replacement ES device from its protective package until immediately before you are ready to install it. (Most replacement ES devices are packaged with leads electrically shorted together by conductive foam, aluminum foil or comparable conductive material.)
7. Immediately before removing the protective material from the leads of a replacement ES device, touch the protective material to the chassis or circuit assembly into which the device will be installed.
CAUTION: Be sure no power is applied to the chassis or circuit, and observe all other safety precautions.
8. Minimize bodily motions when handling unpackaged replacement ES devices. (Otherwise harmless motion such as the brushing together of your clothes fabric or the lifting of your foot from a carpeted floor can generate static electricity sufficient to damage an ES device.)

General Soldering Guidelines

1. Use a grounded-tip, low-wattage soldering iron and appropriate tip size and shape that will maintain tip temperature within the range 500°F to 600°F.
2. Use an appropriate gauge of resin-core solder composed of 60 parts tin/40 parts lead.
3. Keep the soldering iron tip clean and well-tinned.
4. Thoroughly clean the surfaces to be soldered. Use a small wire-bristle (0.5 inch or 1.25 cm) brush with a metal handle. Do not use freon-propelled spray-on cleaners.
5. Use the following desoldering technique.
 - a. Allow the soldering iron tip to reach normal temperature (500°F to 600°F).
 - b. Heat the component lead until the solder melts. Quickly draw away the melted solder with an anti-static, suction-type solder removal device or with solder braid.
CAUTION: Work quickly to avoid overheating the circuit board printed foil.
6. Use the following soldering technique.
 - a. Allow the soldering iron tip to reach normal temperature (500°F to 600°F).
 - b. First, hold the soldering iron tip and solder strand against the component lead until the solder melts.
 - c. Quickly move the soldering iron tip to the junction of the component lead and the printed circuit foil, and hold it there only until the solder flows onto and around both the component lead and the foil.
CAUTION: Work quickly to avoid overheating the circuit board printed foil or components.
 - d. Closely inspect the solder area and remove any excess or splashed solder with a small wire-bristle brush.

Use Soldering Iron to Pry Leads

IC Removal/Replacement

Some Hitachi unitized chassis circuit boards have slotted holes (oblong) through which the IC leads are inserted and then bent flat against the circuit foil. When holes are the slotted type, the following technique should be used to remove and replace the IC. When working with boards using the familiar round hole, use the standard technique as outlined in paragraphs 5 and 6 above.

Removal

1. Desolder and straighten each IC lead in one operation by gently prying up on the lead with the soldering iron tip as the solder melts.

2. Draw away the melted solder with an anti-static suction-type solder removal device (or with solder braid) before removing the IC.

Replacement

1. Carefully insert the replacement IC in the circuit board.
2. Carefully bend each IC lead against the circuit foil pad and solder it.
3. Clean the soldered areas with a small wire-bristle brush. (It is not necessary to reapply acrylic coating to areas.)

"Small-signal" Discrete Transistor Removal/Replacement

1. Remove the defective transistor by clipping its leads as close as possible to the component body.
2. Bend into a "U" shape the end of each of three leads remaining on the circuit board.
3. Bend into a "U" shape the replacement transistor leads.
4. Connect to replacement transistor leads to the corresponding leads extending from the circuit board and crimp the "U" with long nose pliers to insure metal to metal contact, then solder each connection.

Power Output Transistor Devices Removal/Replacement

1. Heat and remove all solder from around the transistor leads.
2. Remove the heatsink mounting screw (if so equipped).
3. Carefully remove the transistor from the circuit board.
4. Insert new transistor in circuit board.
5. Solder each transistor lead, and clip off excess lead.
6. Replace heatsink.

Diode Removal/Replacement

1. Remove defective diode by clipping its leads as close as possible to diode body.
2. Bend the two remaining leads perpendicularly to the circuit board.
3. Observing diode polarity, wrap each lead of the new diode around the corresponding lead on the circuit board.
4. Securely crimp each connection and solder it.
5. Inspect (on the circuit board copper side) the solder joints of the two "original leads". If they are not shiny, reheat them and, if necessary, apply additional solder.

Fuses and conventional Resistor Removal/Replacement

1. Clip each fuse or resistor lead at top of circuit board hollow stake.
2. Securely crimp leads of replacement component around stake 1/8 inch from top.
3. Solder the connections.

CAUTION: Maintain original spacing between the replaced component and adjacent components and the circuit board, to prevent excessive component temperatures.

Circuit Board Foil Repair

Excessive heat applied to the copper foil of any printed circuit board will weaken the adhesive that bonds the foil to the circuit board, causing the foil to separate from, or "lift-off" the board. The following guidelines and procedures should be followed whenever this condition is encountered.

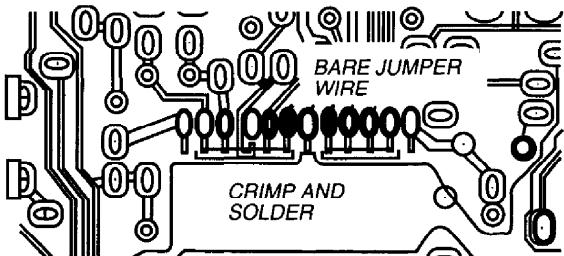

In Critical Copper Pattern Areas

High component/copper pattern density and/or special voltage/current characteristics make the spacing and integrity of copper pattern in some circuit board areas more critical than in others. The circuit foil in these area is designated as Critical Copper Pattern. Because Critical Copper Pattern requires special soldering techniques to ensure the maintenance of reliability and safety standards, contact your Hitachi personnel.

At IC Connections

To repair defective copper pattern at IC connections, use the following procedure to install a jumper wire on the copper pattern side of the circuit board. (Use this technique only on IC connections.)

1. Carefully remove the damaged copper pattern with a sharp knife. (Remove only as much copper as absolutely necessary.)
2. Carefully scratch away the solder resist and acrylic coating (if used) from the end of the remaining copper pattern.

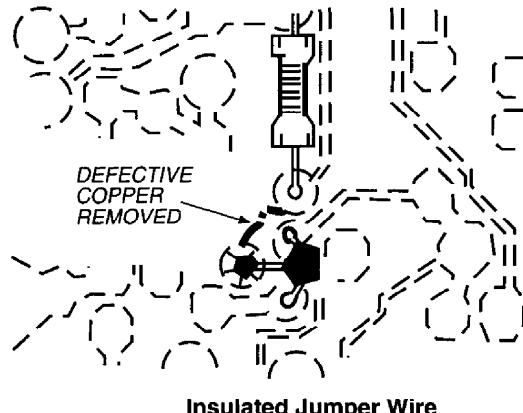

Install Jumper Wire and Solder

3. Bend a small "U" in one end of a small-gauge jumper wire and carefully crimp it around the IC pin. Solder the IC connection.
4. Route the jumper wire along the path of the cut-away copper pattern and let it overlap the previously scraped end of the good copper pattern. Solder the overlapped area, and clip off any excess jumper wire.

At Other Connections

Use the following technique to repair defective copper pattern at connections other than IC Pins. This technique involves the installation of a jumper wire on the component side of the circuit board.

Insulated Jumper Wire

1. Remove the defective copper pattern with a sharp knife. Remove at least 1/4 inch of copper, to ensure hazardous condition will not exist if the jumper wire opens.
2. Trace along the copper pattern from both wire sides of the pattern break and locate the nearest component directly connected to the affected copper pattern.
3. Connect insulated 20-gauge jumper wire from the nearest component on one side of the pattern break to the lead of the nearest component on the other side. Carefully crimp and solder the connections.

CAUTION: Be sure the insulated jumper wire is dressed so that it does not touch components or sharp edges.

Frequency Synthesis (FS) Tuning Systems

1. Always unplug the instrument AC power cord before disconnecting or reconnecting FS tuning system cables and before removing or inserting FS tuning system modules.
2. The FS tuner must never be disconnected from the FS tuning control module while the power is applied to the instrument.
3. When troubleshooting intermittent problems that might be caused by defective cable connection(s) to the FS tuning system, remove the instrument AC power as soon as the defective connector is found and finish confirming the bad connection with a continuity test. This procedure will reduce the probability of electrical overstress of the FS system semi-conductor components.

NOTE: These components are affixed with glue. Be careful not to break or damage any foil under the component or at the pins of the ICs when removing. Usually applying heat to the component for a short time while twisting with tweezers will break the component loose.

Leadless Chip Components (surface mount)

Chip components must be replaced with identical chips due to critical foil track spacing. There are no holes in the board to mount standard transistors or diodes. Some chip capacitor or resistor board solder pads may have holes through the board, however the hole diameter limits standard resistor replacement to 1/8 watt. Standard capacitors may also be limited for the same reason. It is recommended that identical chip components be used.

Chip resistors have a three digit numerical resistance code - 1st and 2nd significant digits and a multiplier. Example: 162 = 1600 or 1.6K resistor, 0 = 0 (jumper).

Chip capacitors generally do not have the value indicated on the capacitor. The color of the component indicates the general range of the capacitance.

Chip transistors are identified by a two letter code. The first letter indicates the type and the second letter, the grade of transistor.

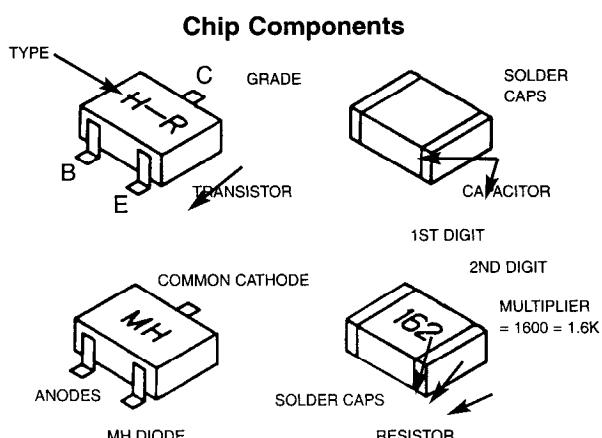

Chip diodes have a two letter identification code as per the code chart and are a dual diode pack with either common anode or common cathode. Check the parts list for correct diode number.

Component Removal

1. Use solder wick to remove solder from component end caps or terminals.
2. Without pulling up, carefully twist the component with tweezers to break the adhesive.
3. Do not reuse removed leadless or chip components since they are subject to stress fracture during removal.

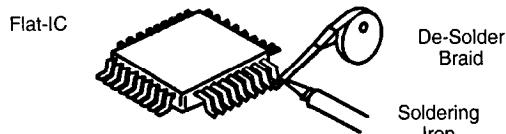

Chip Component Installation

1. Put a small amount of solder on the board soldering pads.
2. Hold the chip component against the soldering pads with tweezers or with a miniature alligator clip and apply heat to the pad area with a 30 watt iron until solder flows. Do not apply heat for more than 3 seconds

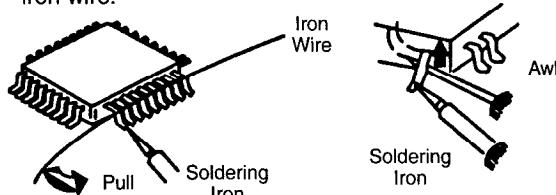

How to Replace Flat-IC —Required Tools—

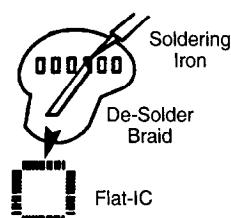

- Soldering iron
 - De-solder braids
 - Iron wire or small awl
 - Magnifier
1. Remove the solder from all of the pins of a Flat-IC by using a de-solder braid.

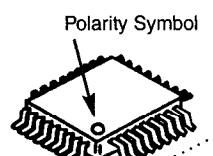

2. Put the iron wire under the pins of the Flat-IC and pull it in the direction indicated while heating the pins using a soldering iron. A small awl can be used instead of the iron wire.

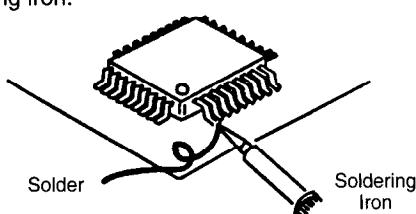

3. Remove the solder from all of the pads of the Flat-IC by using a de-solder braid.

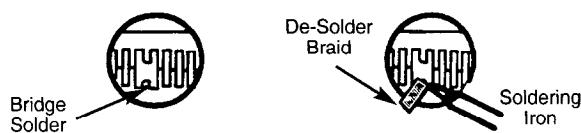

4. Position the new Flat-IC in place (apply the pins of the Flat-IC to the soldering pads where the pins need to be soldered). Properly determine the positions of the soldering pads and pins by correctly aligning the polarity symbol.

5. Solder all pins to the soldering pads using a fine tipped soldering iron.

6. Check with a magnifier for solder bridge between the pins or for dry joint between pins and soldering pads. To remove a solder bridge, use a de-solder braid as shown in the figure below.

AGENCY REGULATORY INFORMATION

Federal Communications Commission Notice

This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and the receiver.
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- Consult the dealer or an experienced radio or television technician for help.

Modifications

The FCC requires the user to be notified that any changes or modifications made to this device that are not expressly approved by Hitachi Home Electronics (America), Inc. may void the user's authority to operate the equipment.

Cables

Connections to this device must be made with shielded cables with metallic RFI/EMI connector hoods to maintain compliance with FCC Rules and Regulations.

Any cables that are supplied with the system must be replaced with identical cables in order to assure compliance with FCC rules. Order Hitachi spares as replacement cables.

Declaration of Conformity

This device complies with Part 15 of the FCC Rules. Operation is subject to the following two conditions: (1) this device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

Any cables that are supplied with the system must be replaced with identical cable in order to assure compliance with FCC rules. Order Hitachi spares as replacement cables.

For questions regarding this declaration, contact:

Hitachi Home Electronics (America), Inc.

TECHNICAL SPECIFICATIONS

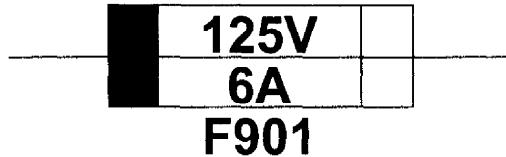

PICTURE TUBE

36SDX88B/MM1.....A90AGW14X04

CAUTION!

The following symbol near the fuse indicates fast operating fuse (to be replaced). Fuse ratings appear within the symbol.

Example:

The rating of fuse F901 is 6.0A-125V.
Replace with the same type fuse for continued protection against fire.

Inputs:

- Power Input AC 120V, 60Hz
- Power Consumption 180W
- Power Consumption (maximum) 240W
- Antenna input impedance 75 Ohm
- Channel coverage 181 ch.
- VHF-Band 2 ~ 13
- UHF-Band 14 ~ 69
- CATV Mid Band A-5 ~ A-1
Mid Band A-I
- Super Band J-W
- Hyper Band W+1 - W+28
- Ultra Band W+29 - W+84
- Video input 1.0Vp-p, 75 Ohm
- S-Video input
Luminance (Y) 1.0Vp-p, 75 Ohm
Chrominance (C_B, C_R) 0.286Vp-p, 75 Ohm
- Audio input level (average) 400mVrms, 47K Ohm

Outputs:

- Audio Output (variable) 400mVrms, 1K Ohm
- Video Output 1.0Vp-p, 75 Ohm

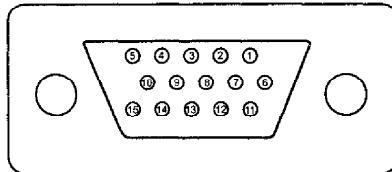

Dimensions:

- Height (in.) 29^{17/32} in.
- Width (in.) 35 in.
- Depth (in.) 24^{13/32} in.
- Weight (lbs.) 164 lbs.

TECHNICAL CAUTIONS

HV Protection Circuit Operation Checking

High voltage limiter circuit operation check and over voltage protection circuit operation check.

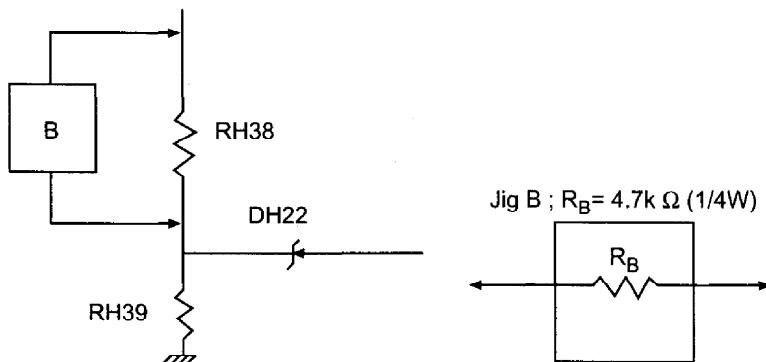

Adjustment Preparation

- (1) Connect a high voltage voltmeter between CPT anode terminal (Anode cap side) and the ground as below.
- (2) Set AC input voltage to $120 \pm 2\text{V}$.
- (3) Receive Hitachi circle pattern and set "Brightness" and "Contrast" to maximum. Adjust Screen VR so that Beam Current is $I_B = 1.15 \pm 0.1\text{mA}$. (The voltage of ABL terminal-CH22 both ends should be 12V or less).

Adjustment Procedure

- (1) Check that the normal High Voltage is $30.0 \pm 0.2\text{kV}$ and +B Voltage is $220 \pm 1\text{V}$.
- (2) Connect jig B to the both end of RH38 and check that power turn off and standby mode is set.

- (3) Disconnect the AC plug and remove jig B.
- (4) Turn the main power on. Check if power is supplied and high voltage rises.

FRONT PANEL CONTROLS

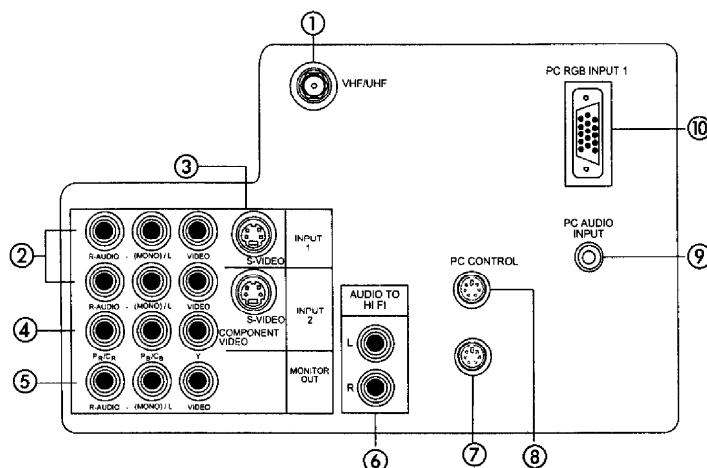

FRONT VIEW

REAR PANEL JACKS

REAR VIEW

① Antenna Inputs

The VHF/UHF terminal can be used for normal TV, cable TV (CATV), a video game, etc.

② Audio/Video Inputs 1,2

The INPUT button will step through each signal source input each time it is pressed. Use the audio and video inputs to connect external devices, such as VCRs, camcorders, laserdisc players, DVD players etc. (If you have mono sound, insert the audio cable into the left channel jack.)

③ S-Video 1,2

Input provides S-Video (Super Video) jacks for connecting equipment with S-Video output capability.

④ Component: Y-C_BC_R/Y-P_BP_R Input 2

Input 2 provides Y-C_BC_R/Y-P_BP_R jacks for connecting equipment with this capability, such as a DVD player.

⑤ Monitor Out

These jacks provide fixed audio and video signals which are used for recording.
There is NO MONITOR OUT when using COMPONENT VIDEO.

⑥ Audio to Hi-Fi

These jacks provide variable audio output to a separate stereo amplifier. With this connection, the audio to the stereo can be controlled by the PC ready color television's main volume. Use these jacks for the SURROUND Left and Right channels.

⑦ NOTE: The mini DIN 6 Pin Keyboard terminal underneath the PC Control at rear panel does not work on this model.

⑧ PC Control

Use this input for remote control mouse operation.

⑨ PC Audio Input

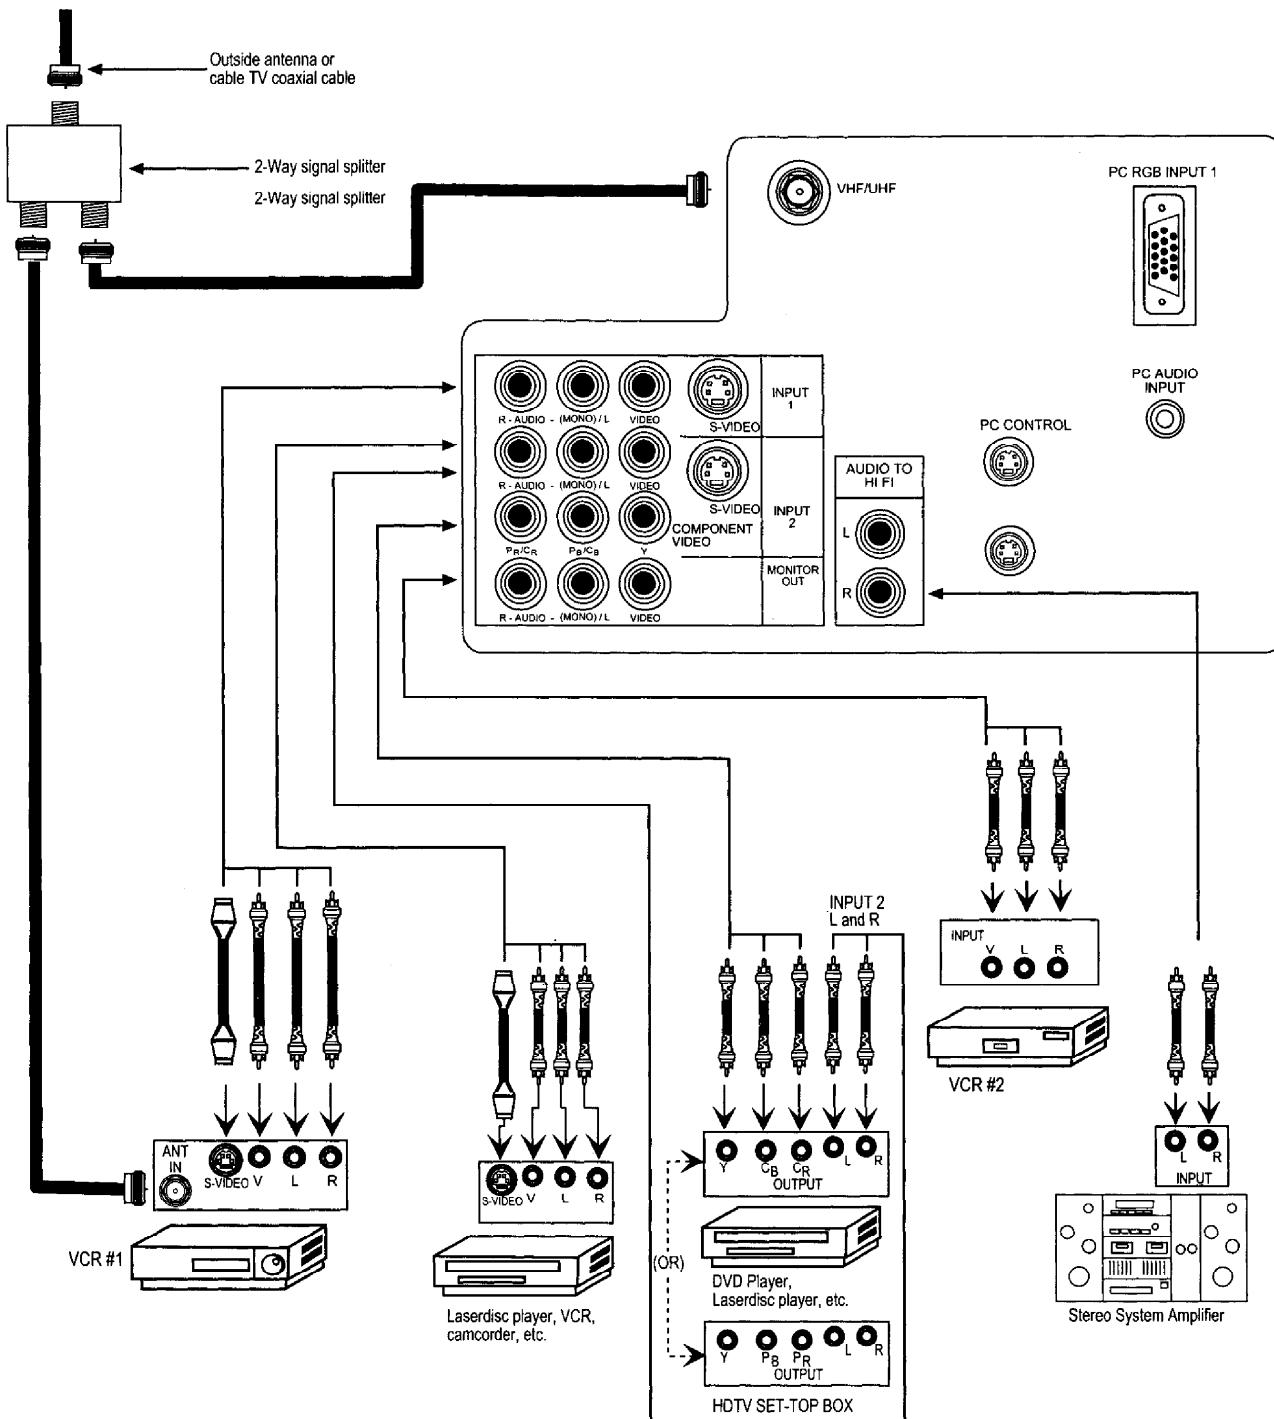

Connect external devices for audio in PC mode.

⑩ PC RGB Input 1 (RGB1)

Use this 15-pin D-Sub Input for your PC connection.

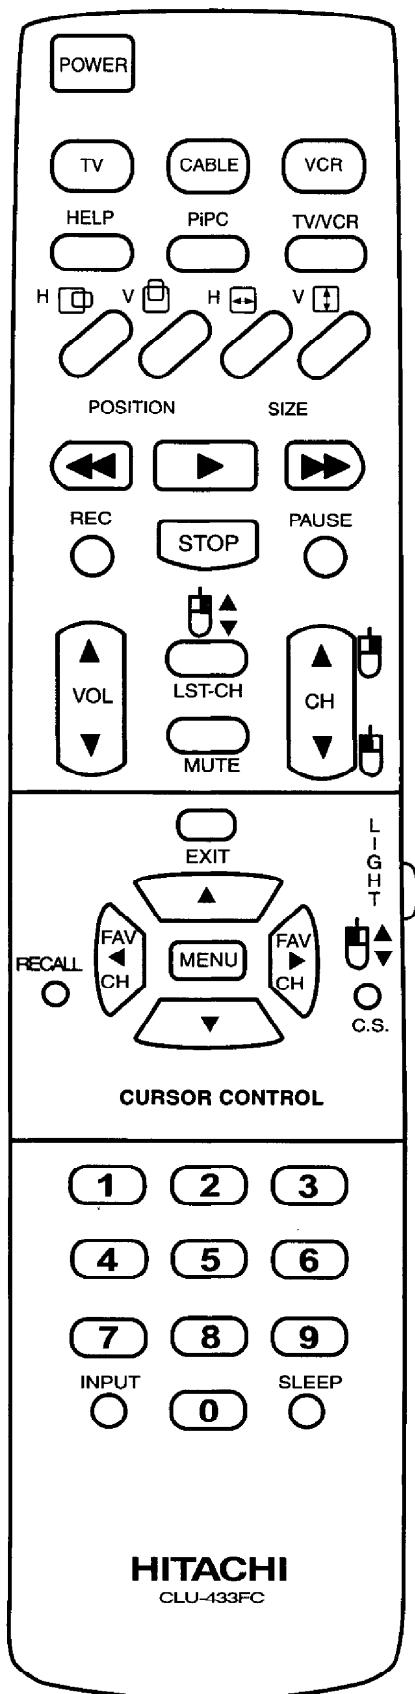

REAR PANEL CONNECTIONS

NOTE: Connect only 1 component to each input jack.

THE REMOTE TO CONTROL YOUR TV

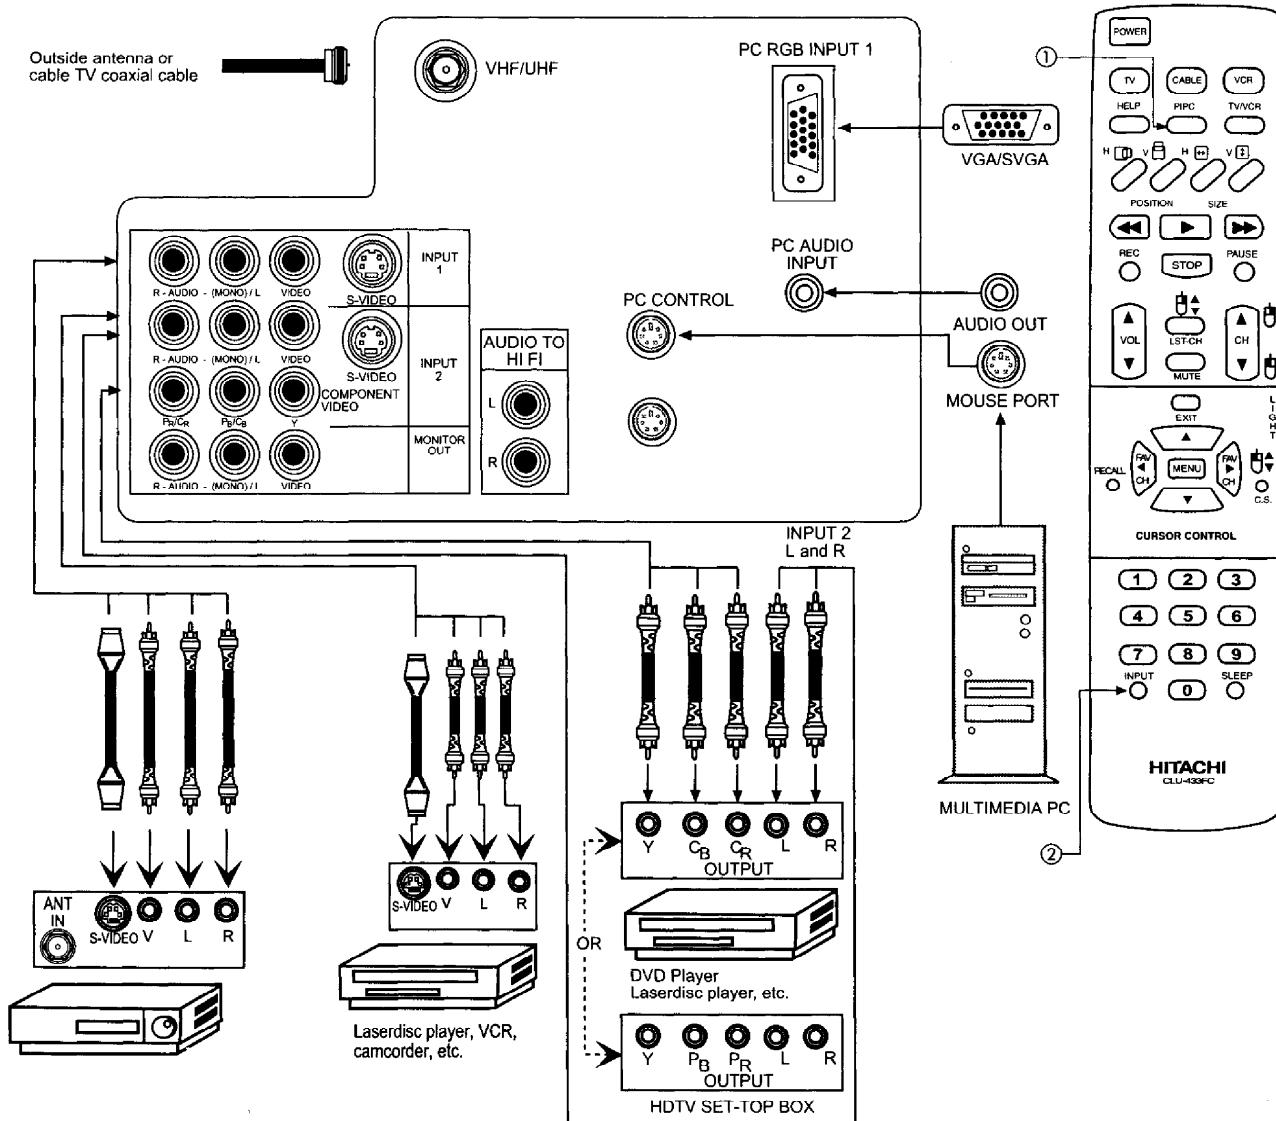

PICTURE-IN-PC

Your PC ready color TV incorporates PinPC technology designed for improved viewing enjoyment.

The Picture-in-PC feature is convenient when you want to watch a program. You can watch your PC operation while viewing other programs from Antenna, Video and component input sources.

PC input sources can only be viewed as a main picture.

Antenna, Video and component inputs can be viewed as the sub-picture.

① PiPC Button

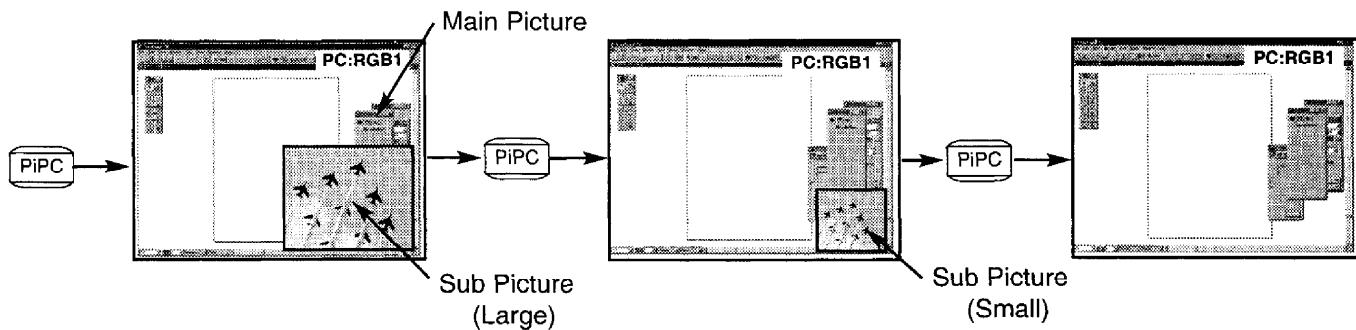

Press the PiPC Button and a Sub-Picture will appear. This PiPC works only on PC mode.

② Input Button

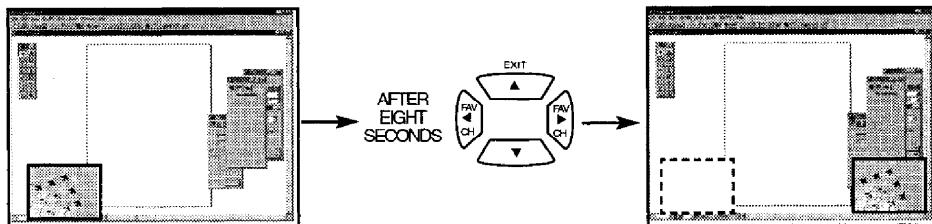

Press Input to change Sub-Picture Input Source.

NOTE: When PiPC is on Antenna Source, press channel ▲, ▼ to change channel or use number button.

PICTURE-IN-PC

It is also possible to customize the PiPC position. To do this, wait until the On-Screen Display disappears (about eight seconds) and then use the CURSOR ▶, ◀ buttons. Press CURSOR ▲, ▼ to select Audio Input source to TV or PC mode.

NOTE: PinPC works correctly when receiving the following signal timings, horizontal and vertical position of PinPC may not work correctly with other timings.

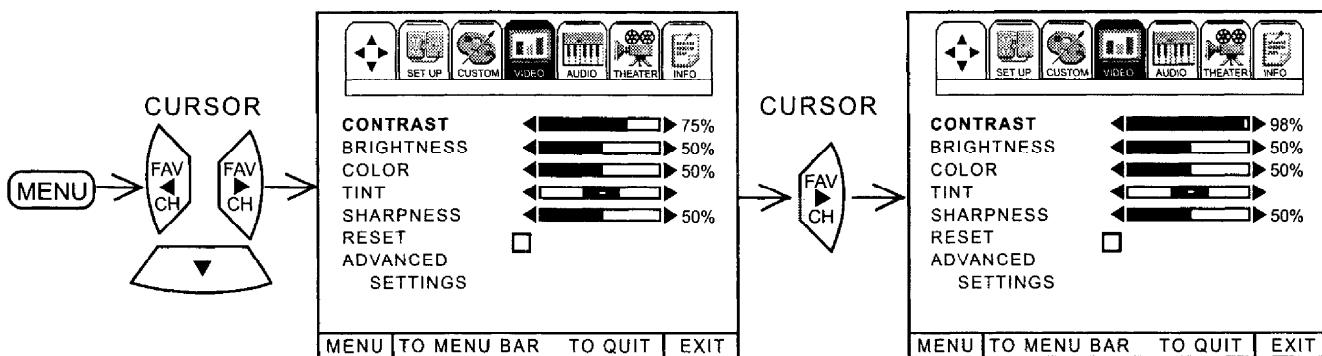

Signal	Resolution	Horizontal		Vertical	
		Freq. (kHz)	Polarity	Freq. (Hz)	Polarity
VGA	640x480	31.5	Negative	60	Negative
VGA	640x480	37.8	Negative	72	Negative
SVGA	800x600	37.8	Positive	60	Positive

NOTE: Component input with High Definition (1080 I) and Standard Definition (480P) Digital signals do not show up on the PinPC sub-picture because digital decoding is only for the main picture.

NOTE: If PinPC is activated, the remote control mouse operation does not work. Use the PC mouse for control instead of the remote control mouse.

Select VIDEO to adjust picture settings and improve picture quality.

Use the CURSOR ▲ or ▼ buttons to highlight the function to be adjusted.

Press the CURSOR ◀ or ▶ buttons to adjust the function.

Press EXIT to quit menu, or CURSOR ◀ to return to previous menu.

NOTE:

- If CONTRAST is selected, you are adjusting CONTRAST. The additional menu items BRIGHTNESS, COLOR, TINT, and SHARPNESS can be selected and adjusted in the same manner.
- Contrast and Brightness adjustments will affect only the main picture. These adjustments will not affect the sub-picture.

CONTRAST

Use this function to change the contrast between black and white levels in the picture.

BRIGHTNESS

Use this function to adjust overall picture brightness.

COLOR

Use this function to adjust the level of color in the picture.

TINT

Use this function to adjust flesh tones so they appear natural. (It may be necessary to adjust TINT to obtain optimum picture quality when using the COMPONENT: Y-P_BP_R/Y-C_BC_R Input 2 jacks).

SHARPNESS

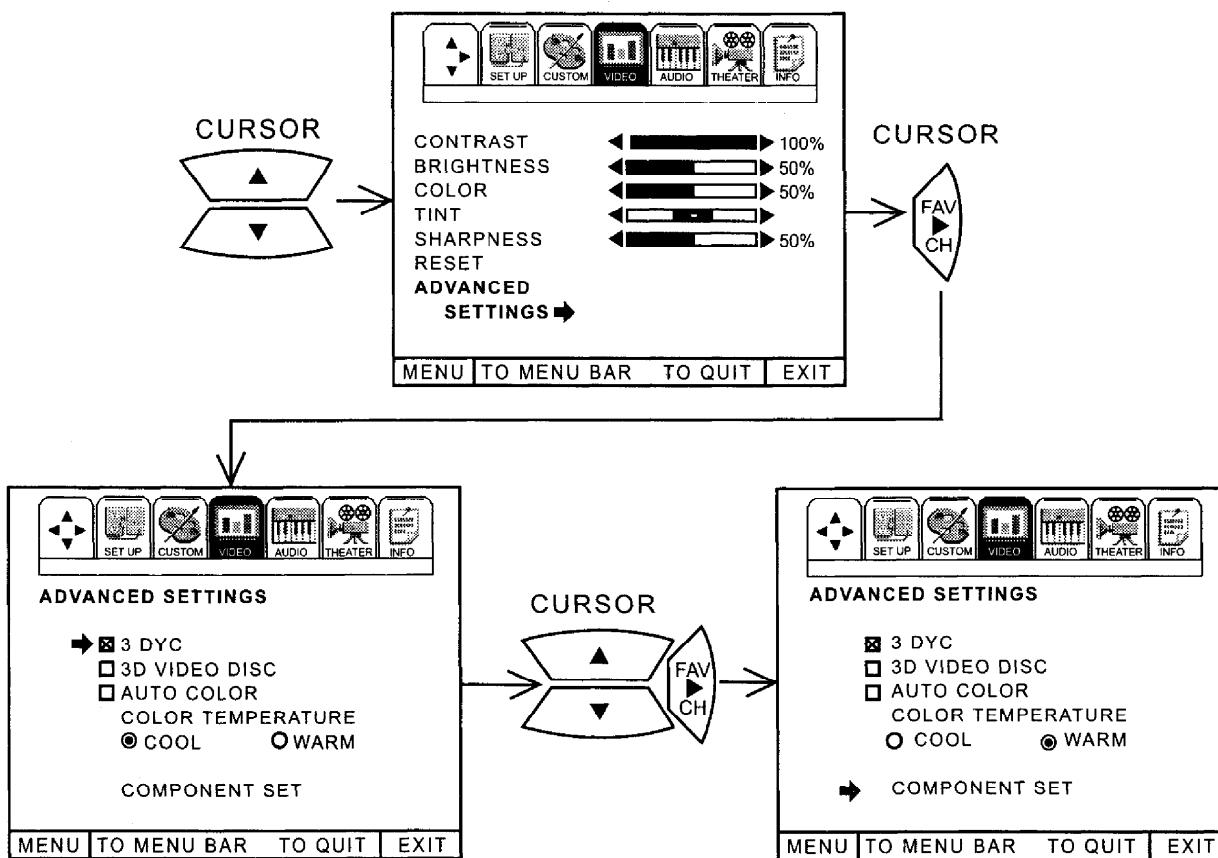

Use this function to adjust the amount of fine detail in the picture.

RESET

When RESET is selected, the "ARE YOU SURE?" display will appear on the screen to confirm your choice.
Press CURSOR ▶ to return VIDEO adjustments to factory preset conditions.

ADVANCED SETTINGS

Your PC ready color TV has the following functions which will adjust picture settings to produce the highest quality picture possible.

Use CURSOR ▲ or ▼ to select function.

Use CURSOR ► to change the function setting. When the function has an "X" in the box, it is ON.

Press EXIT to quit menu or CURSOR ◀ to return to previous menu.

3DYC (DIGITAL 3DYC COMB FILTER)

The 3DYC function automatically turns on the 3 Dimension Luma and Chroma filter. This lessens the dot crawl and cross color. Turn on 3DYC to eliminate flickering, or picture artifacts, that a detailed pattern or scene would normally cause.

3D VIDEO DISC

Turn on for 3D Video programs. Use this mode only when input signal is 3 Dimension. If activated and PC ready color TV turns off, 3D video disc is deactivated.

AUTO COLOR

The AUTO COLOR function automatically monitors and adjusts the color to maintain constant color levels even after a program or channel changes. It also maintains natural flesh tones while preserving fidelity of background colors.

NOTE: It may be necessary to set AUTO COLOR-ON to obtain optimum picture quality when using the COMPONENT: Y-C_BC_R/Y-P_BP_R Input 2 jacks.

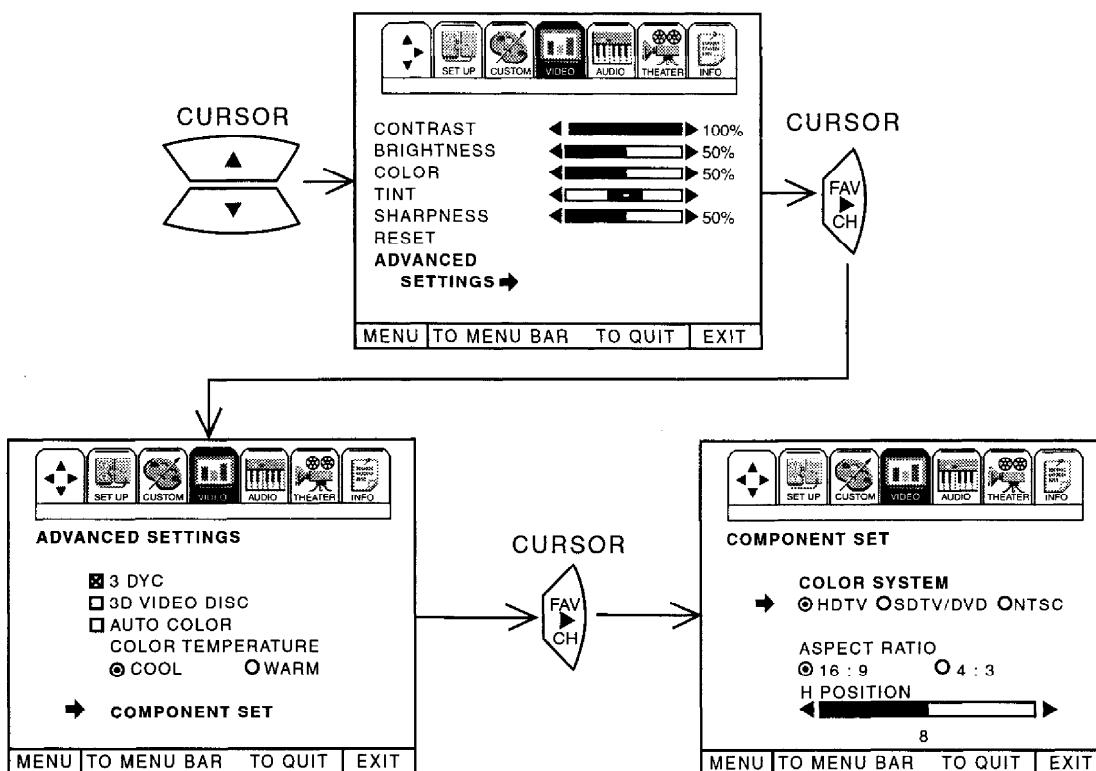

COLOR TEMPERATURE

Use this function adjust the white balance (hue) of the picture to your own color preference.

Set this to WARM for hotter colors with more red, or set to COOL for less intense colors with more blue.

**ADVANCED SETTINGS****COMPONENT SET**

The COMPONENT SET function is very useful when setting up High Definition, Standard Definition and NTSC signal while changing the aspect ratio and moving the Horizontal Position.

Press CURSOR ▶ to select Color System (HDTV, SDTV/DVD, NTSC).

Press CURSOR ▼ to change position.

Press CURSOR ▲ or ▼ to highlight then CURSOR ▶ to select ASPECT RATIO (16 : 9, 4 : 3).

Press CURSOR ▼, ▶ to highlight then CURSOR ▶ to select H Position.

NOTE: Set up a Component Signal and switch to Video 2 by pressing the Input Button on the Remote Control when planning to use the component set function.

COLOR SYSTEM

The COLOR SYSTEM function allows you to change tint and color coordinate for DTV Programs.

HDTV - High Definition Television - Use for High Vision Signal Y-PBPR from HDTV Set-Top Box.

SDTV/DVD - Standard Definition Television or Digital Video Disc Y-CBCR such as DVD (Digital Video Disc Player).

NTSC - Basic U.S. Standard Normal Signal Standardized by the National Television Standard Committee.

ASPECT RATIO

16 : 9 - Screen changes to 16 : 9 aspect ratio.

HDTV signal is normally 16 : 9 aspect ratio.

4 : 3 - Screen changes to 4 : 3 aspect ratio.

SDTV and NTSC signals are normally 4 : 3 aspect ratio.

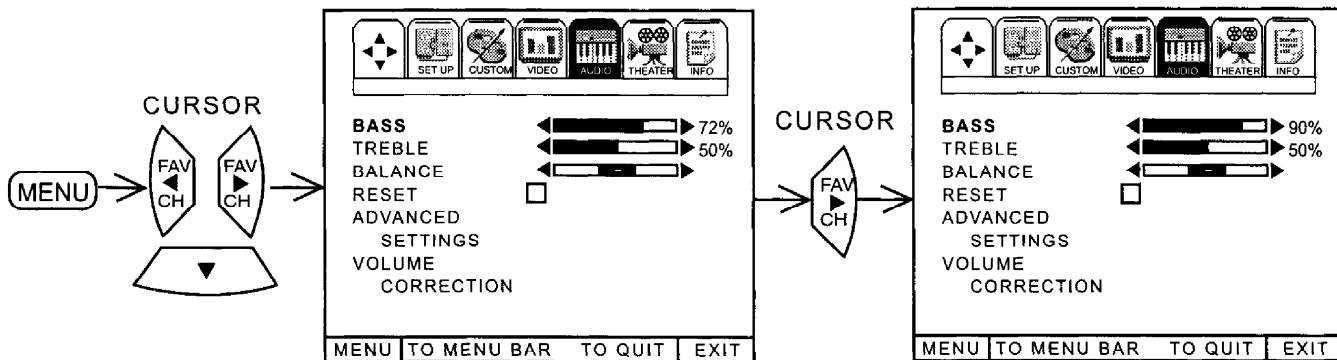

H POSITION

This function allows you to adjust the Horizontal Position on DTV mode. This is convenient when using SET TOP BOX.

AUDIO

Select AUDIO SETTINGS to adjust the PC ready color TV to your preference and to improve the sound quality.

Use CURSOR ▲ or ▼ to highlight the function to be adjusted.

Press CURSOR ◀ or ▶ to adjust the function.

Press EXIT to quit menu or cursor ◀ to return to previous menu.

NOTE: If BASS is selected you are adjusting BASS. The additional menu items TREBLE and BALANCE can be selected and adjusted in the same manner.

BASS

This function controls the low frequency audio to all speakers.

TREBLE

This function controls the high frequency audio to all speakers.

BALANCE

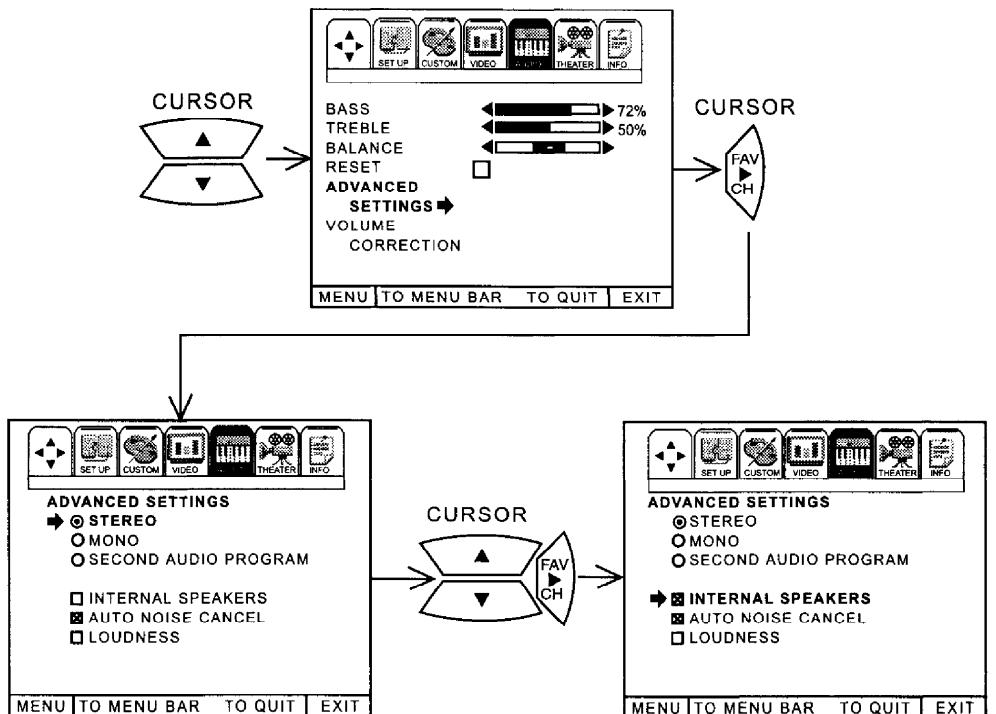

This function will control the left to right balance of the TV internal speakers and the AUDIO TO HI FI output.

RESET

When RESET is selected, the "ARE YOU SURE?" display will appear on the screen to confirm your choice.
Press CURSOR ▶ to return AUDIO adjustments to factory preset conditions.

**ADVANCED SETTINGS**

Use ADVANCED SETTINGS to improve the sound performance of your PC ready color TV, depending on listening conditions.

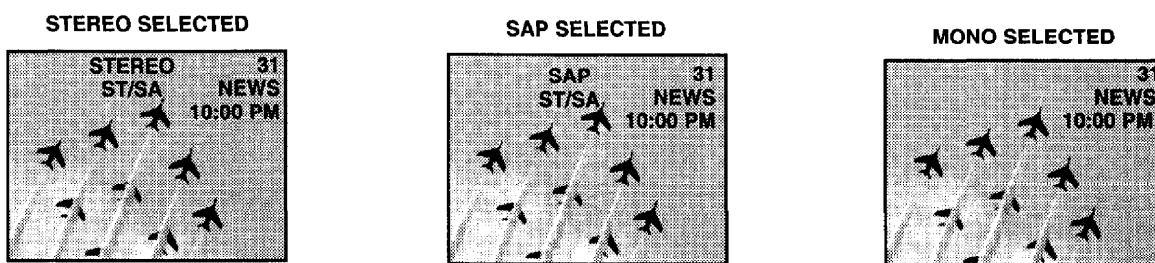

Press CURSOR ▲ or ▼ to highlight a function. Press CURSOR ► to change the function setting. When the function has an "X" in the box, it is ON. Press EXIT to quit menu or CURSOR ◀ to return to previous menu.

MTS MODE

Multi-Channel Television Sound (MTS) will allow you to select STEREO (a Stereo Broadcast), MONO (Monaural Sound) used when receiving a weak stereo broadcast or SAP (Second Audio Program) which may be a secondary language, weather report, etc.

The sources received will be displayed at the top center edge of the PC ready color TV. The source you select will be displayed above the sources received. See example below for each selection when both stereo and second audio are received (monaural is always received).

**INTERNAL SPEAKERS**

This function is useful when first setting up the external speakers, or if you prefer to use only speakers from a separate stereo system.

AUTO NOISE CANCEL

This function eliminates the noise in between stations. If a channel is tuned and is noisy, this function will automatically eliminate the audio for that channel and set to blue screen.

LOUDNESS

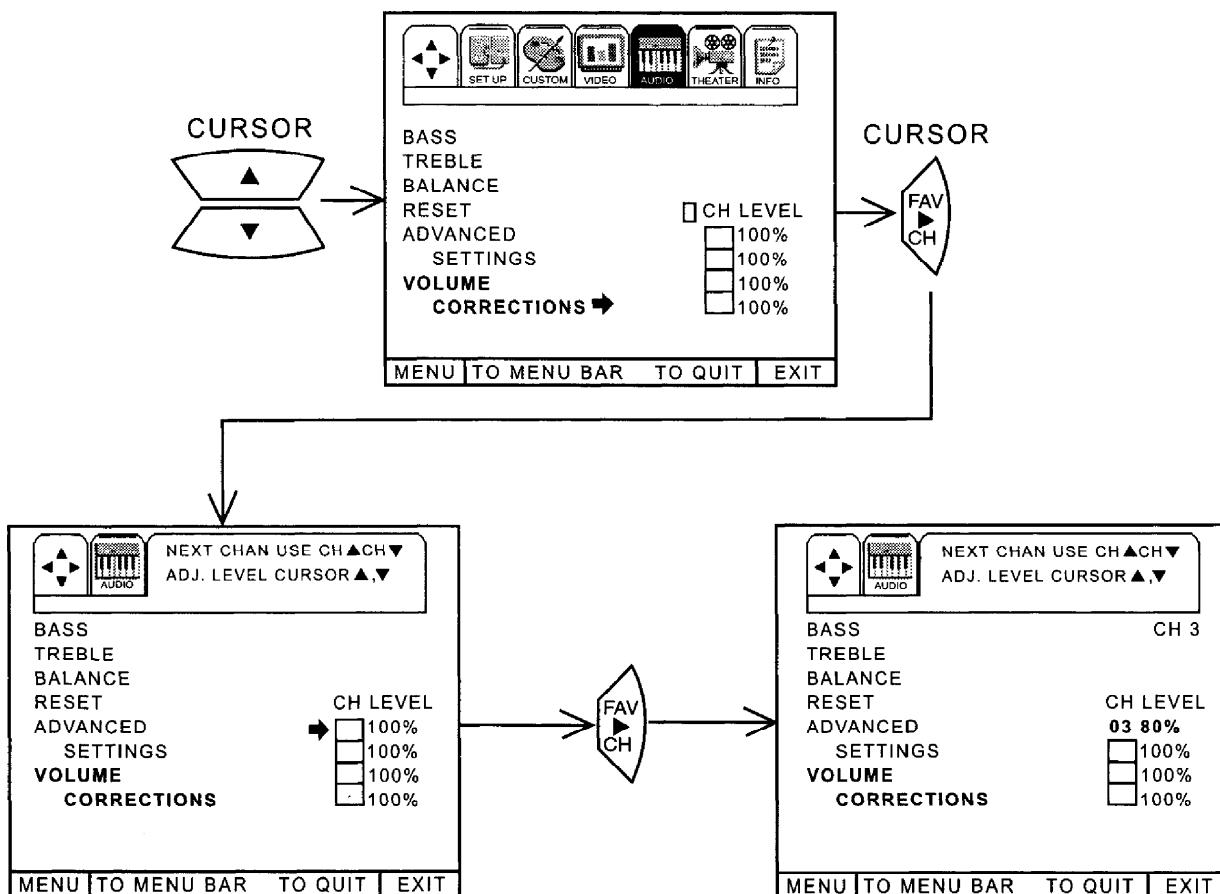

This function will improve the quality of both low and high frequency sounds when listening at low volume levels.

AUDIO

VOLUME CORRECTION

Use this function to reduce the volume level of up to four channels that sound loud compared to other channels.

Press CURSOR ▲ or ▼ to highlight one of the four volume corrections, then CURSOR ► to select.

Press CHANNEL ▲ or ▼ and number buttons to select a channel.

Press CURSOR ▲ or ▼ to adjust volume level in 5% increments.

Press EXIT to quit menu or CURSOR ◀ to return to previous menu.

- NOTE:**
1. Volume Correction adjustment is for the channel display in the top right corner of the screen.
 2. If the channel is already set, use CURSOR ► to select that channel, then use CURSOR ▲ or ▼ to change the level.
 3. To erase a channel from volume correction, select channel 00 and press MENU.
 4. The volume level will change from 50% to 100% in increments of 5%.

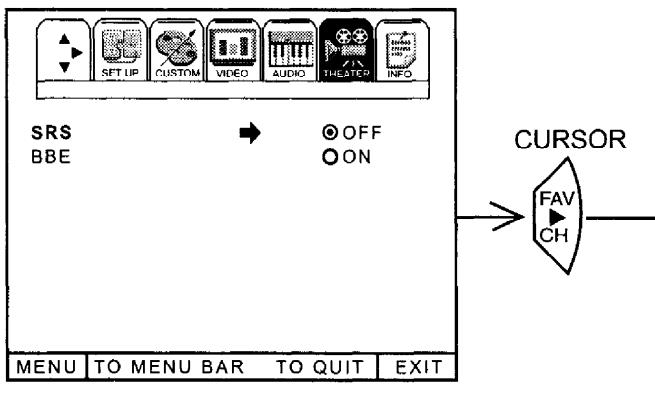

THEATER

Use this function to choose audio settings for a true home THEATER experience.

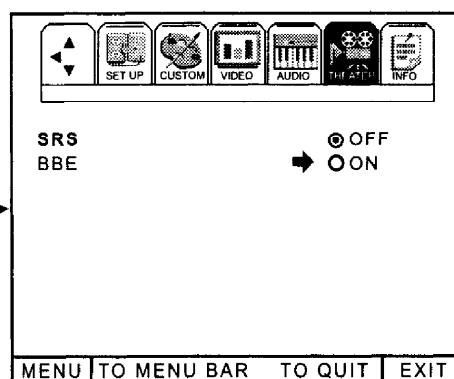

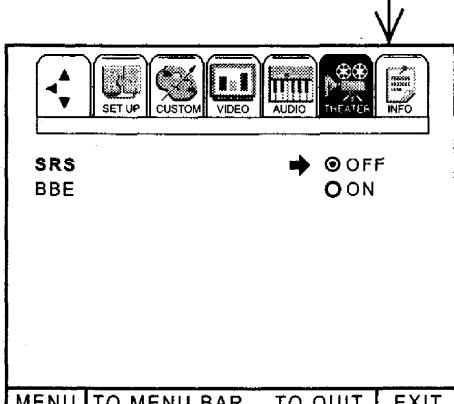

Based on the principles of the human hearing system, SRS technology delivers an exciting and realistic 3D Sound experience from just two speakers (or) the two internal speakers of your HITACHI PC ready color television. If your HITACHI PC ready color television is connected to an external audio system, SRS will also create an incredible 3D sound experience from two speakers and even enhance a complete multi-speaker surround sound system.

TV MODE

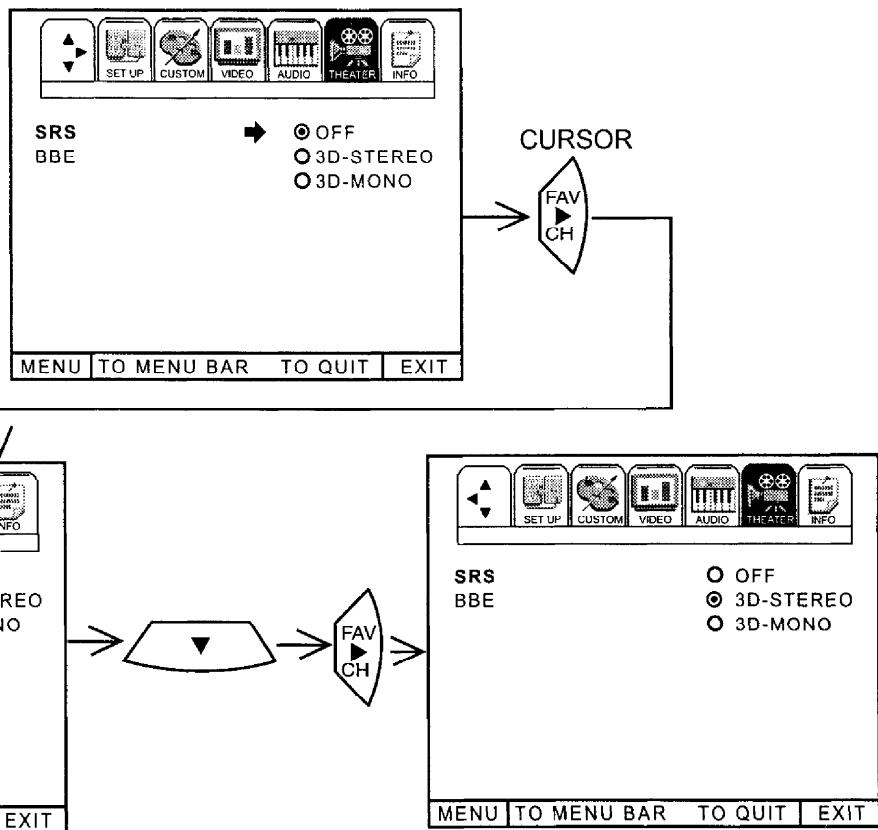

CURSOR

NOTE: TV Mode - This mode is when Input selection is on Antenna or Cable.

NOTE: SRS, the SRS symbol and Sound Retrieval System are registered trademarks of SRS Labs, Inc. in the U.S. and selected countries. SRS Technology is manufactured under license from SRS Labs, Inc. and is protected by USA patents 4,748,669 and 4,841,572 and additional patents worldwide.

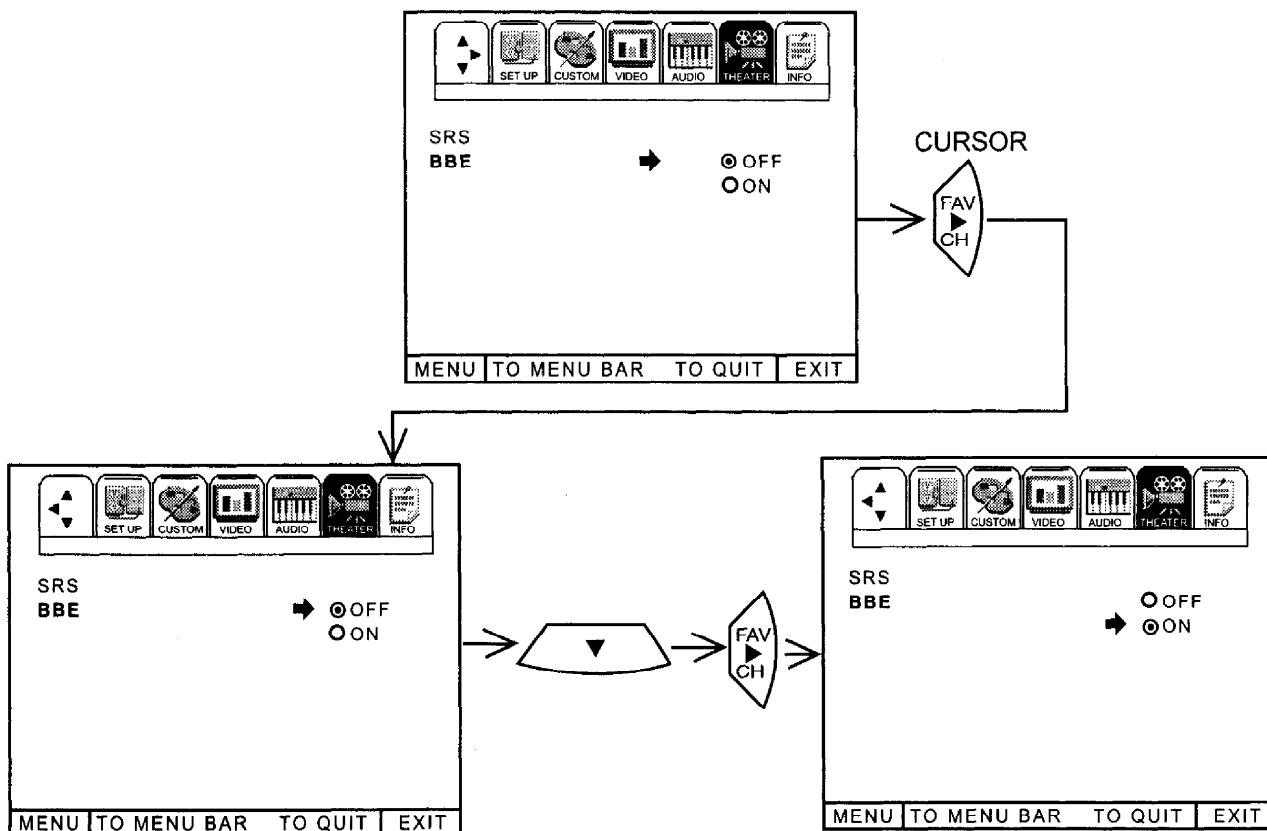

SRS (○)
VIDEO MODE

USE CURSOR ▲ or ▼, then CURSOR ► to set SRS OFF, 3D-STEREO or 3D-MONO.
Press EXIT to quit menu or CURSOR ◀ to return to previous menu.

NOTE: VIDEO MODE - This mode is when Input selection is from VIDEO Inputs.

Sound reproduction quality enhancement system. The BBE technology produces sound that is natural and crisp from just two speakers (or) the two internal speakers of your HITACHI PC ready color television. If your HITACHI PC ready color television is connected to an external audio system, BBE will also create an incredible crisp sound experience from two speakers and even enhance a complete multi-speaker surround sound system. BBE brings to the listener's ear a more complete and accurate reproduction of the original performance. Each voice, speaking or singing, each instrument or sound effect is presented with its attendant harmonics or partials more clearly audible. The ear can then more easily recognize the unique tonal colors of each sound as though the sound was being produced live.

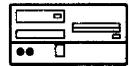

Use CURSOR ▲ or ▼, then CURSOR ► to set BBE ON or OFF.
Press EXIT to quit menu or CURSOR ◀ to return to previous menu.

NOTE: BBE functions the same manner on TV mode and on VIDEO mode.

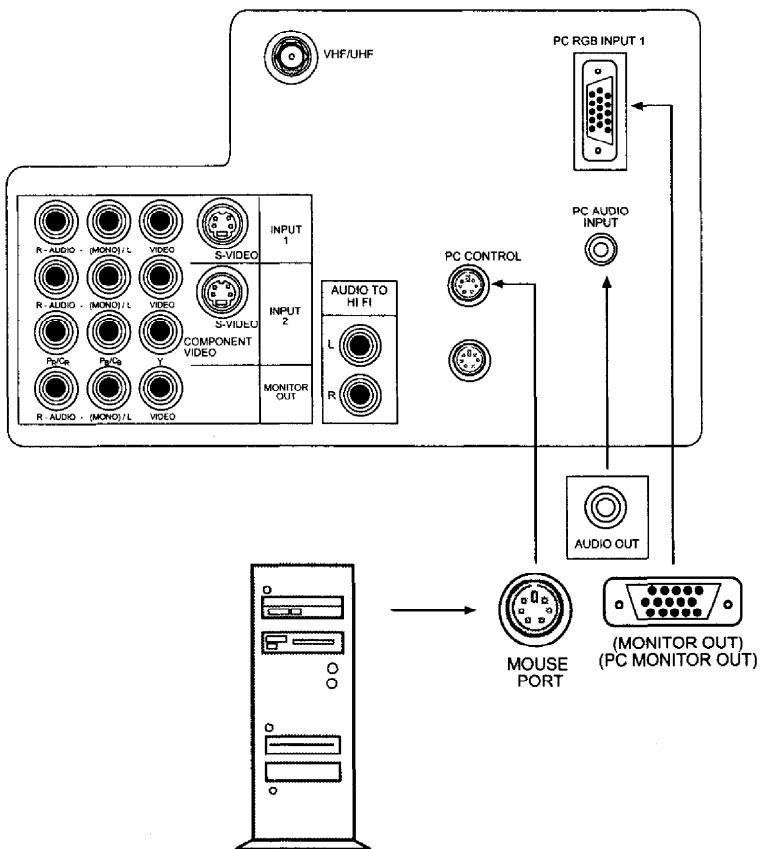

NOTE: The mark BBE and the BBE symbol are trademarks of BBE Sound, Inc. Manufactured under license from BBE Sound, Inc. US pat. 4,638,258, 4,482,866 and 5,510,752.

PC MODE CONNECTION AND OPERATION

IMPORTANT: TURN OFF THE TV/PC MONITOR AND THE PC BEFORE CONNECTING OR DISCONNECTING ANY CABLES.

REAR PANEL CONNECTION TO PC

- NOTE:**
1. This monitor can display VGA and SVGA formats:
VGA 1 640 X 480 (horizontal frequency: 31.469Khz, vertical frequency: 60.00Hz)
VGA 2 640 X 480 (horizontal frequency: 37.861Khz, vertical frequency: 72.809Hz)
SVGA 800 X 600 (horizontal frequency: 37.879Khz, vertical frequency: 60.317Hz)
LED flashes and PC picture does not appear at all when receiving a signal which is not supported on spec.
If PC display setting is wrong the monitor will display: "Please set PC for 640 x 480 60Hz, 640 x 480 72Hz, 800 x 600 60Hz display."
 2. This monitor uses PS/2 format for the mouse interface. On some PC's, the mouse control may not work in the following situations:
 - Disconnecting and reconnecting mouse cable while PC ready color TV and PC power is turned on.
 - Turning on the PC power before turning on the PC ready color TV power.
 - Operating systems other than Windows 3.1x and Windows 95.
- Consult your PC operation manual for the keyboard keys to re-start or shutdown your computer.

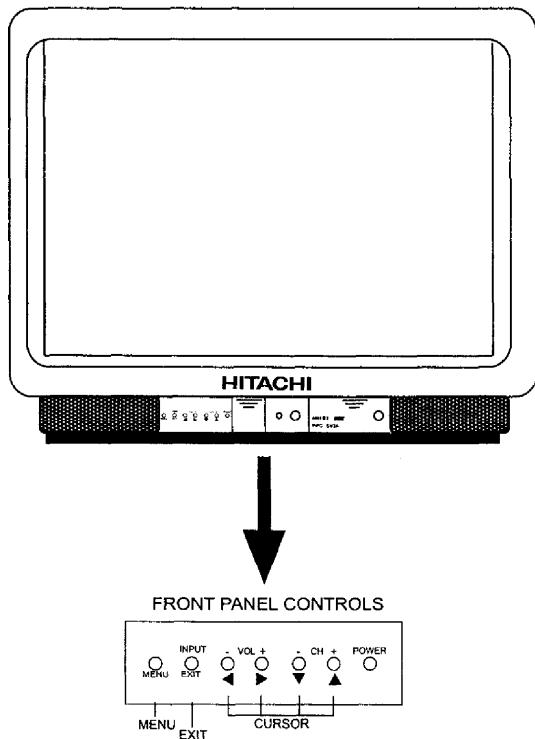

NOTE: If PC is set to correct horizontal and vertical frequencies and the picture is out of sync or scrambled, check the video card documentation and set up software to properly set the monitor.

NOTE: The Mini DIN 6 pin keyboard terminal underneath the PC CONTROL at rear panel does not work on this model.

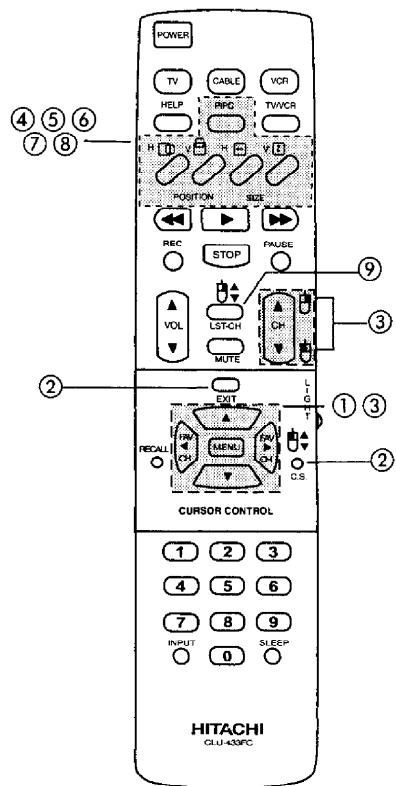

PC MODE CONTROLS

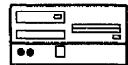

1. FRONT PANEL

2. REMOTE CONTROL

PC MODE CONTROLS

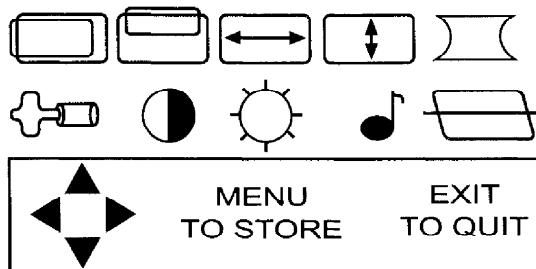

① MENU Button

Press MENU to display PC mode On-Screen Display.

PC MAIN MENU

There are ten features that allow you to set up your multimedia vision (while in PC Mode) to your preference. Features are H Position, V Position, H Size, V Size, Pincushion, Set Up, Contrast, Brightness, Audio and Tilt.

After completing adjustment, press MENU to store.

② EXIT Button

Press EXIT button to exit the on-screen display.

③ CURSORS Button

Use Left/Right cursors to highlight a feature and Up/Down cursors to select the highlighted item, then use left/right cursors to adjust. These buttons are also used for mouse cursor remote control operation.

④ PinPC Button

Press this button to go to PinPC mode. This function works on PC mode only.

⑤ H POSITION Button

Press to display PC horizontal position adjustment bar. Press cursor left/right to adjust PC horizontal position.

⑥ V POSITION Button

Press to display PC vertical position adjustment bar. Press cursor left/right to adjust PC vertical position.

⑦ H SIZE Button

Press to display PC horizontal size adjustment bar. Press cursor left/right to adjust PC horizontal size.

⑧ V SIZE Button

Press to display PC vertical size adjustment bar. Press cursor left/right to adjust PC vertical size.

⑨ LAST CHANNEL (LST-CH) Button /

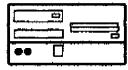

Press to perform mouse right button drag, toggle.

⑩ COMMERCIAL SKIP (CS) Button /

Press to perform left button drag, toggle.

⑪ CHANNEL UP/DOWN Button /

Use the channel up (▲) button to perform a right click. Use the channel down (▼) button to perform a left click.

PC MOUSE CONTROL AND AUDIO INPUT OPERATION

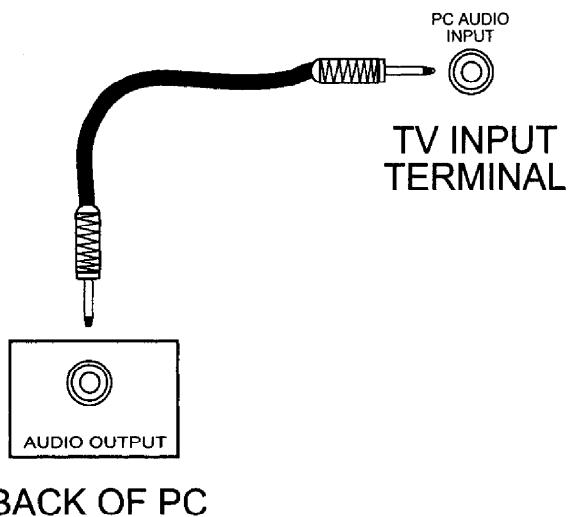

IMPORTANT: TURN POWER OFF ON THE TV/PC MONITOR AND THE PC BEFORE CONNECTING OR DISCONNECTING ANY CABLES.

PC MOUSE CONTROL OPERATION

1. Connect the 6 pin-din cable (provided) to the PC and monitor.
2. Turn the TV/PC monitor power on.
3. Press the input button on the front panel or on the remote control until you select PC mode.
4. Turn the PC power on.
5. After the PC has completed booting, use the cursor buttons on the PC ready color TV front panel or on the remote control to move the mouse cursor up/down/left/ or right to make selections. Use the channel down, channel up, C.S., and LST-CH buttons to perform other mouse functions. (, , ,)

PC AUDIO INPUT OPERATION

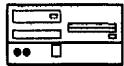

1. Connect the audio output of the PC to the PC Audio Input on the TV/PC monitor as shown below.

2. Turn the TV/PC monitor power on.
3. Press the input button on the front panel or on the remote control until you select PC mode.
4. Turn the PC power on.
5. Press volume up (▲) or down (▼) to increase or decrease the sound level.
6. Press the menu button on the TV/PC monitor front panel or on the remote control to display the PC on-screen display.
7. Press the right (►) or left (◀) cursor buttons to select the audio menu
8. Press the up(▲) or down (▼) cursor buttons to access the audio adjustment functions.

NOTE: Make sure that the Remote Control is on TV Mode (not VCR or CABLE) when using the Cursor and Mouse control buttons.

PC ON-SCREEN DISPLAY

PICTURE ADJUSTMENTS

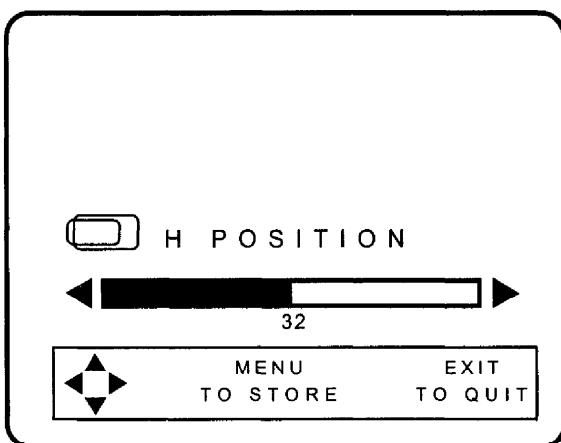

The following adjustments are independent of the TV mode:

- Press MENU in PC mode for on-screen display.
- Press CURSORS right (►) or (◀) left to highlight the item to be adjusted.
- Press CURSORS up (▲) or down (▼) to select the highlighted item.
- Use CURSORS right (►) or (◀) left to adjust.

H POSITION

This feature allows you to adjust the horizontal position of the display.

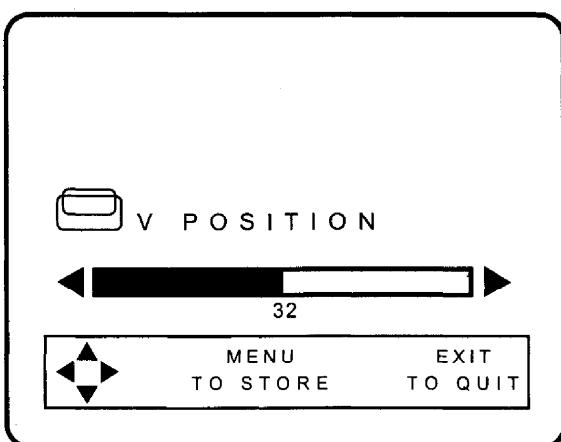

Use Left/Right cursors to adjust the horizontal position.
Press the MENU button to store and EXIT to quit.

V POSITION

This feature allows you to adjust the vertical position in PC mode.

Use Left/Right cursors to adjust the vertical position.
Press MENU button to store and EXIT to quit.

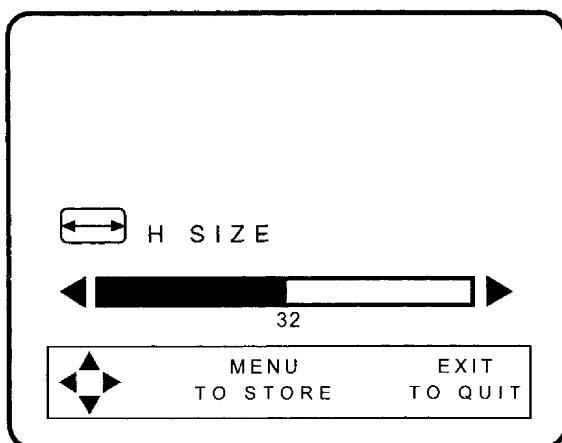

PC ON-SCREEN DISPLAY

H SIZE

This feature allows you to adjust the horizontal size in PC Mode.

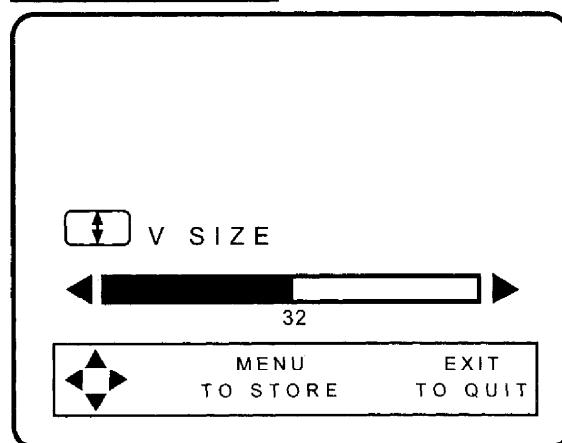

Use Left/Right cursors to adjust the horizontal size.
Press MENU button to store and EXIT to quit.

V SIZE

This feature allows you to adjust the vertical size in PC mode.

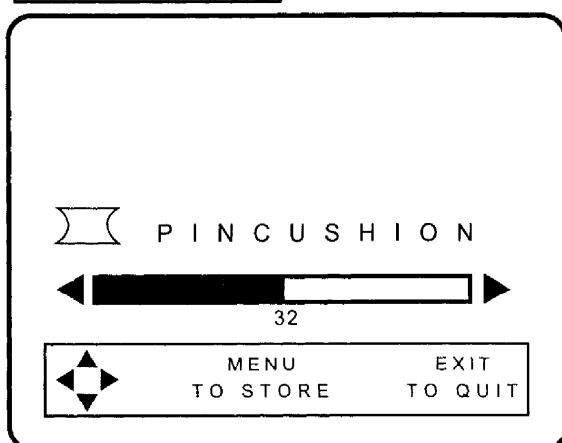

Use Left/Right cursors to adjust the vertical size.
Press MENU button to store and EXIT to quit.

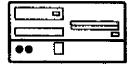

PINCUSHION

This feature allows you to adjust the left and right sides (pincushion) in PC Mode.

Use Left/Right cursors to adjust pincushion.
Press the MENU button to store and EXIT to quit.

PC ON-SCREEN DISPLAY

SET UP ADJUSTMENTS

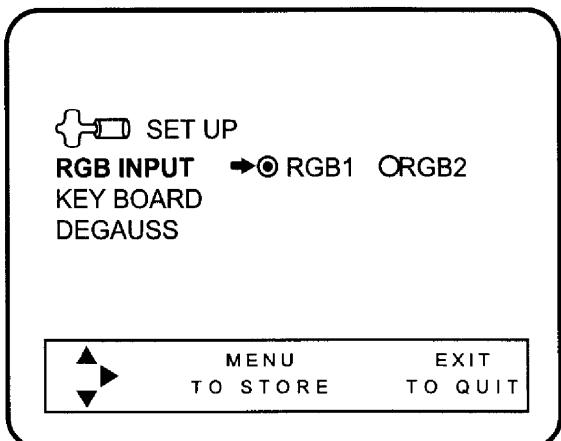

The following adjustments are independent of the TV mode:

- Press MENU in PC mode for on-screen display.
- Press CURSORS right ► or ◀ left to highlight the item to be adjusted.
- Press CURSORS up ▲ or down ▼ to select the highlighted item.
- Use CURSORS right ► or ◀ left to adjust.

RGB INPUT

This feature allows you to select PC INPUT between RGB1 or RGB2.

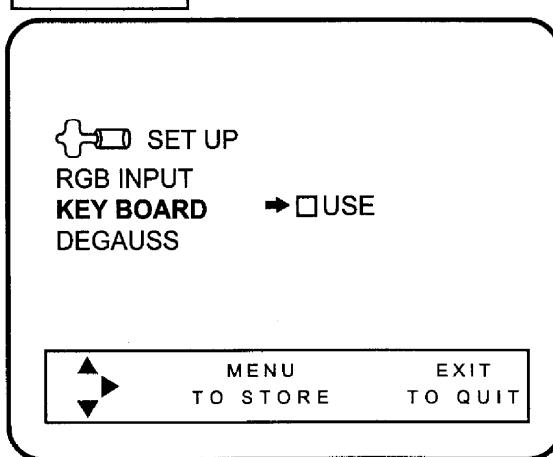

- Use right CURSOR ► to select between RGB1 or RGB2.
- Press MENU button to store and EXIT to quit.
- RGB1 when selected, the PC Input will be on the Rear Panel.
- RGB2 when selected, the PC Input will be on the Front Panel.

KEYBOARD

This feature allows you to use the Remote Control Keyboard.

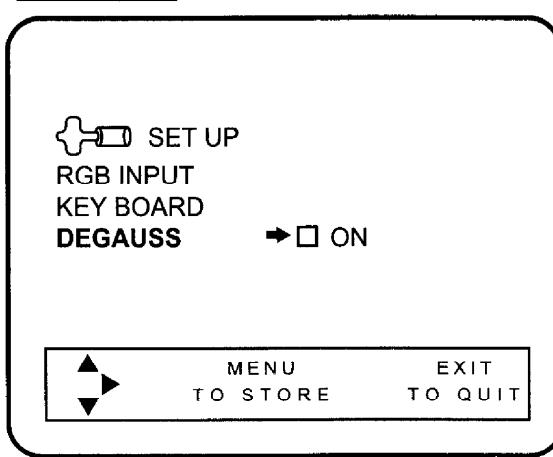

- Use right CURSOR ► to check when Keyboard will be in use.
- Press MENU button to store and EXIT to quit.

NOTE: Please don't check "Keyboard USE" on PC Set Up Menu, otherwise PC CONTROL will not work. Once you change setting of "Keyboard USE" of PC Set Up Menu, you better restart PC to refresh PS/2 communication between your set and PC. The Mini DIN 6 pin keyboard terminal on the Rear Panel does not work on this model.

DEGAUSS

This feature allows you to manually Degauss your set.

- Use right cursor ► to check and turn on the Degaussing Coil.
- Press MENU button to store and EXIT to quit.
- Degauss function is convenient when cleaning any misleading or discolorization in the Picture.
- This will momentarily turn on the Degaussing coil then stop when completed.

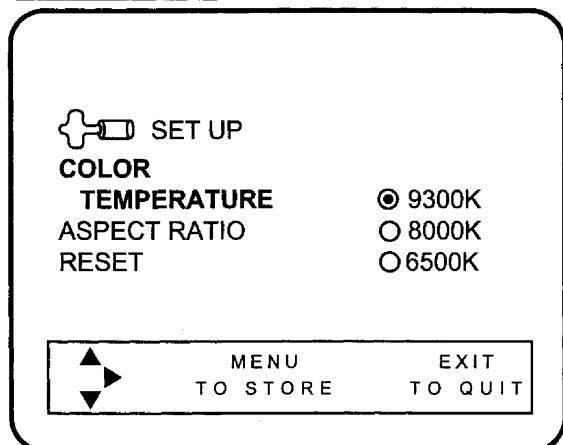

PC ON-SCREEN DISPLAY

SET UP ADJUSTMENTS Press CURSOR ▼ for more set up adjustments.

COLOR TEMPERATURE

This feature allows you to select your color temperature.

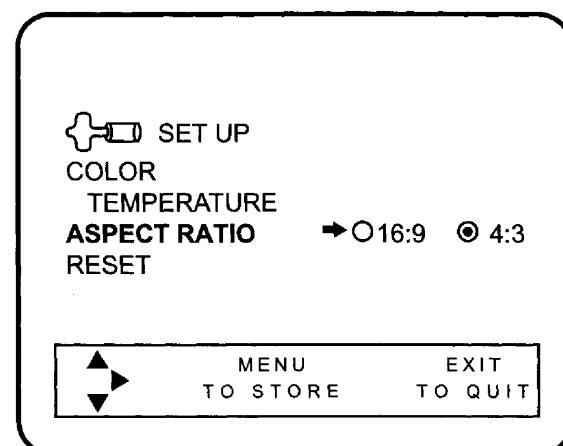

- Use CURSOR ▲ or ▼ then CURSOR ► to set Color Temperature to 9300°K, 8000°K or 6500°K depending on your preference.
- Press MENU button to store and EXIT to quit.

ASPECT RATIO

This feature allows you to select your aspect ratio.

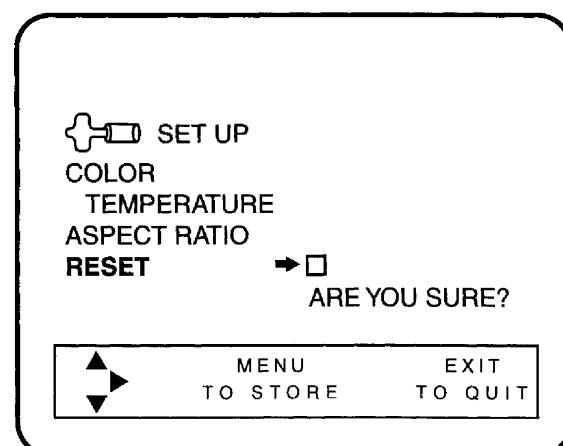

- Use CURSOR ▲ or ▼ then CURSOR ► to select Aspect Ratio from 16:9 or 4:3.
- Press MENU button to store and EXIT to quit.

RESET

This feature allows you to reset the PC ready color television to the Factory Preset Conditions.

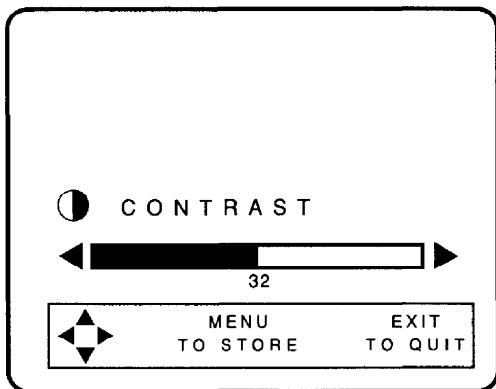

- Use CURSOR ▲ or ▼ then CURSOR ► to select Reset.
- When Reset is selected, the "ARE YOU SURE?" display will appear to confirm your choice.
- Press CURSOR ► to return SET-UP Adjustment to factory preset conditions.
- Press MENU button to store and EXIT to quit.

PC ON-SCREEN DISPLAY

CONTRAST

This feature allows you to adjust the contrast in PC mode.

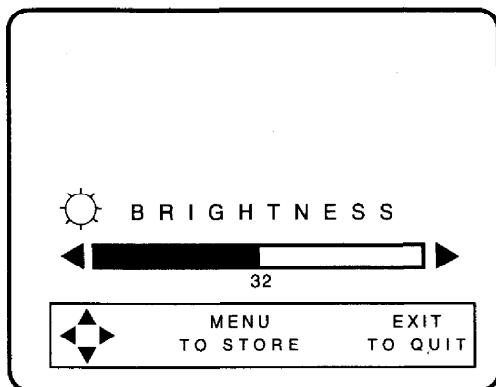

Use Left/Right cursors to adjust contrast.
Press MENU button to store and EXIT to quit.

NOTE: See TV contrast feature for additional information regarding contrast.

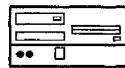

BRIGHTNESS

This feature allows you to adjust brightness in PC Mode.

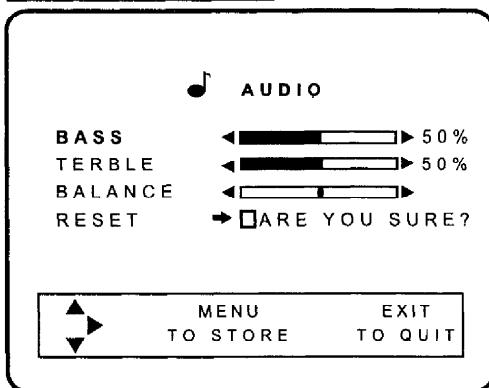

Use Left/Right cursors to adjust brightness.
Press MENU button to store and EXIT to quit.

PC ON-SCREEN DISPLAY

PC AUDIO OPERATION

BASS

This function controls the low frequency audio to all speakers.

TREBLE

This function controls the high frequency audio to all speakers.

BALANCE

This function will control the left to right balance of the TV internal speakers and the AUDIO TO HI FI output.

NOTE: TV mode and PC mode AUDIO have the same effect.

RESET

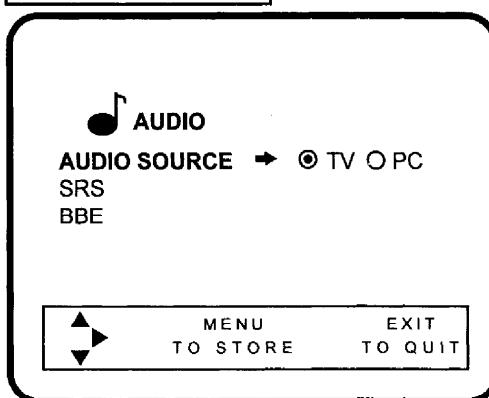

When RESET is selected, the "ARE YOU SURE?" display will appear on the screen to confirm your choice. Press CURSOR ▶ to return AUDIO adjustments to factory preset conditions.

Press CURSOR ▼ for more AUDIO ADJUSTMENT.

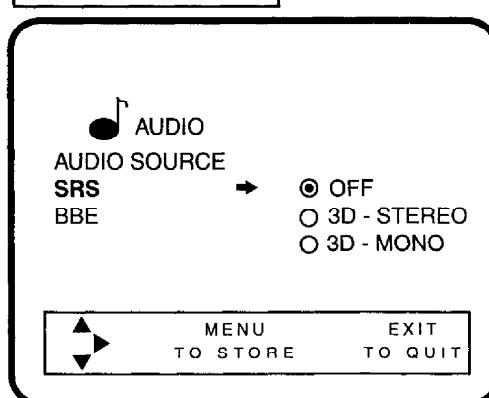

AUDIO SOURCE

This feature allows you to select Audio Source between TV or PC.

SRS (●)

This feature allows you to select SRS in different modes.

Use the CURSOR ▲ or ▼ to highlight the function to be adjusted.

Press CURSOR ◀ or ▶ to adjust the function.

Press MENU button to store and EXIT to quit.

Use CURSOR ▲ or ▼, the CURSOR ▶ to select AUDIO SOURCE between TV or PC.

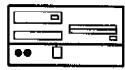

Press MENU button to store and EXIT to quit.

This feature allows you to select SRS in different modes.

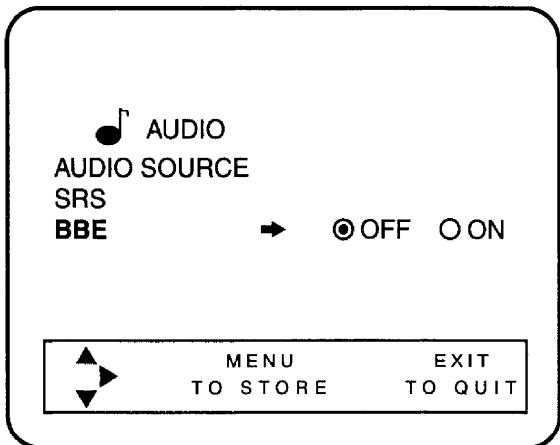

Use CURSOR ▲ or ▼, the CURSOR ▶ to select SRS - OFF, 3D - STEREO or 3D - MONO.

Press MENU button to store and EXIT to quit.

PC ON-SCREEN DISPLAY

This feature allows you to turn on or off the BBE function.

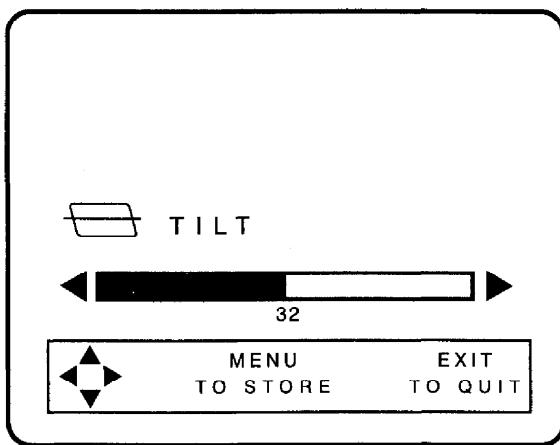

Use CURSOR ▲ or ▼, the CURSOR ► to select BBE and turn it on or off.

Press MENU button to store and EXIT to quit.

This feature allows you to adjust the tilt position of the display.

Use ► or ◀ CURSORS to adjust the horizontal position.

Press MENU button to store and EXIT to quit.

NOTE: Tilt control works only on PC mode, it does not work on TV mode.
If you change tilt setting on PC mode, the tilt data on TV mode will change as well.
Please change mode back to PC mode, then adjust tilt control, if you want to adjust it on TV mode.

FEATURE INFORMATION

As the digital era dawns, Hitachi has models that provide the best possible images today....and tomorrow. Our HDTV-Ready SDX model incorporates new Flex Converter technology to display a high quality 480 P (progressive scanning) image; this same circuitry enables it to accept a full 1080 I HDTV signal from a digital set-top box now or in the future. The SDX model also has a S-VGA input for 800x600 resolution from a computer.

FLEX CONVERTER TECHNOLOGY

With current analog broadcasts, there is just one level of picture quality. In the new age of digital TV, there will be several levels. The highest, called HDTV, can be as high as 1080 I. The standard level, SDTV, can be 480 P or 480 I. Hitachi has developed the Flex Converter, advance circuitry that allows your UltraVision SDX series television to produce true 1080 I HDTV resolution with an HDTV set-top box, it also converts analog 480 I signals to the higher-quality 480 P signals with no scan lines or flicker. SDX needs a set-top box to receive any Digital Signal.

COMPONENT VIDEO

A component Video input accepts separate blue, red & B/W signals from a high resolution digital source as DVD or digital set-top box to provide a higher resolution picture.

3DYC (DIGITAL 3DYC COMB FILTER)

The Digital 3DYC Comb Filter analyzes three lines of information from a single video frame as well as lines from adjacent frames. This technology eliminates the flickering that a detailed pattern or scene would normally cause, for the cleanest, neatest picture possible.

PIPC (PICTURE-IN-PC)

On our 36" SDX model, Picture-in-PC allows you to display images from our computer in the main TV picture, while displaying video (from your antenna or video inputs) in the sub-picture. You can even choose to listen to the sound from the sub-picture.

SRS 3D SURROUND

SRS is a truly dynamic Sound Retrieval System that works whether the signal you receive is stereo or surround encoded. Its genius is that it creates a three-dimensional sound image from only the front speakers by retrieving the spatial information from recordings. The effect is similar to that of a live performance.

BBE HIGH DEFINITION SOUND

BBe professional systems are used in broadcasting, television and recording studios all over the world and by many of the world's most famous musicians in their concerts to achieve the best possible sound. BBe provides a rich and exciting presence, clarity and detail to music. Speech is clearer and more intelligible at lower volume. BBe is a boon to those with hearing problems or for those who enjoy old movies or TV shows. Sound from TV, and even stereo, speakers can sound muddled because certain dynamics of the original recording can be lost. BBe circuitry recreates the clear midrange sounds and crisp highs of the original recording for your enjoyment.

PROGRESSIVE SCANNING

A standard TV uses Interlaced Scanning where each frame of video is broken into two fields, each providing alternating scan lines. This can leave noticeable scan lines and cause flickering. With Progressive Scanning, complete frames are displayed for a smoother picture with no scan lines and no flicker. This allows you to get the optimal picture quality from today's high resolution digital sources such as DVD, a digital set-top box, or with a VGA input, a computer.

ULTRABLACK DIGITAL PITCH PICTURE TUBE

A standard 36" tube has a 1.0 mm dot pitch. The smaller the dots, the sharper the picture. Our 36" SDX model utilizes the UltraBlack Digital Pitch Invar Picture Tube with an ultrafine .78 mm dot pitch, a contributing factor to make HDTV-Ready.

DDC2B PROTOCOL SUPPORT

In order for a computer to recognize a monitor it must have DDC2B support, which you'll find in our 36" SDX model. This allows the computer to recognize the resolution capability of that monitor and then automatically set itself to that level without manual adjustments.

TEST EQUIPMENT RECOMMENDED FOR VIDEO/SIGNAL GENERATOR.

PC MODE

- 1) ASTRO VG-814 or VG-823 Digital Video Generator
from Team Systems.

- 2) LEADER LP1611
DTV Signal Generator.

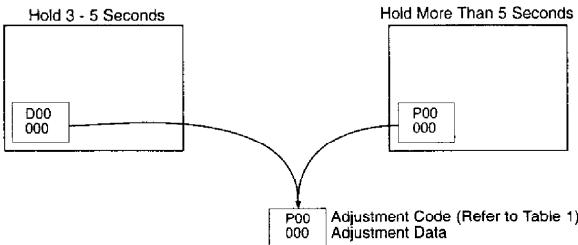

Adjustment Procedures

MAIN CHASSIS ADJUSTMENT

1. ADJUSTMENT PROCEDURE-START UP

How to Get to Adjustment Mode

Chassis adjustment can be done by using the front control panel buttons with CTV set turned off. Press the FRONT PANEL CONTROL "POWER" and "MENU" keys at the same time, and hold more than 3 seconds. The CTV set turns on in adjustment mode with OSD as follows.

"To Escape from Adjustment Mode"

Press "POWER" button of remote control or front panel once at anytime, then set returns to normal.

2. ADJUSTMENT CODES

Table - 1
Adjustment Codes

TV MODE	Adj Code	Function	Range	Service Code ~Data	Remarks
TV	P01	R Drive	0-127	068	
TV	P02	B Drive	0-127	064

TV/PC		V Cutoff	0-128	0	

NOTE: When adjustment code is accessed copy data of Adjustment Code and save for reference.

2-1 Changing Data and Adjustment code

When the CTV set is in adjustment mode, the cursor ▲,▼,◀,▶ and MENU keys of the customers remote control will be the adjustment keys.

- A. Use any Hitachi remote control with MENU button as shown when making an adjustment.

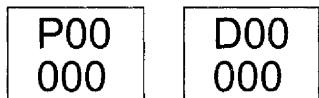

▲,▼ keys are used for changing adjustment code.

◀,▶ keys are used for changing data.

MENU key is used for changing "Cut Off Mode"/"Normal mode." (Refer to cut off adjustment)

3. ADJUSTMENT MODE

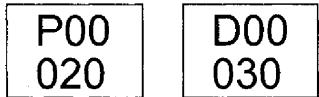

If below display appears

Adjustment code cannot be changed by cursor ▲,▼ keys.

Set data "D020" at "P00" or "D030" at "D00" by ◀,▶ keys.

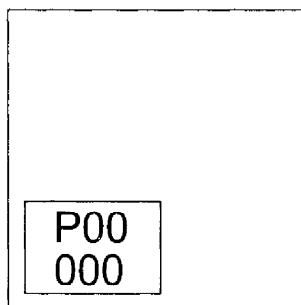

Then adjustment code can be changed by ▲,▼ keys.

B. By Front Control Panel-Another Method

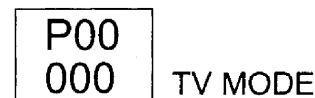

1. Before turning ON the set, press and hold the POWER and MENU buttons for about 3 seconds.

2. After 3 seconds, a small square will appear in the lower left corner. There are two different displays, depending upon how long the MENU button is pressed and held. One shows D for TV/PC adjustment, and the other shows P for the TV/PC picture adjustment.

P= Picture

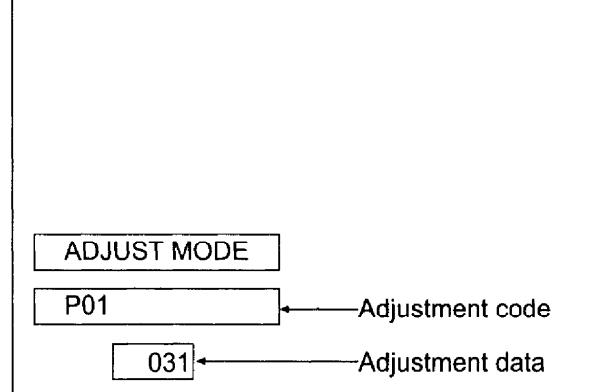

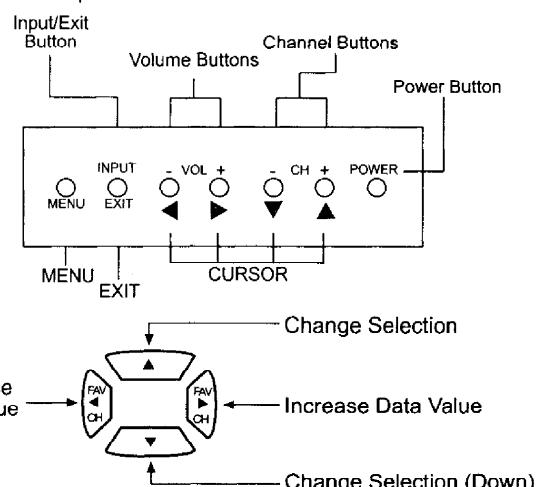

3. To activate the P adjustment mode, input a data value of 20 (020), using the front panel cursor ◀,▶ before any of the picture adjustments can be adjusted.

The same for the D adjustment. To activate the adjustment, you need an input data value of 30 before any of the D adjustments can be adjusted.

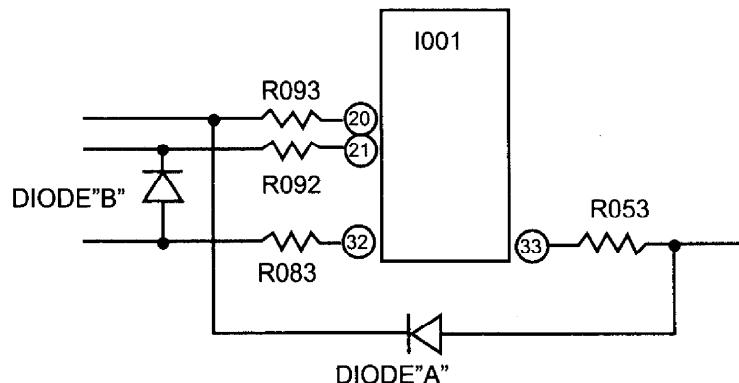

4. To make a selection, you have to use the arrow keys on front panel control.

NOTE: Press MENU button to stop vertical oscillation when selecting P01 to P07 and P17 to P28, then press MENU button again to restart vertical oscillation.
Press POWER button to quit Service Mode.

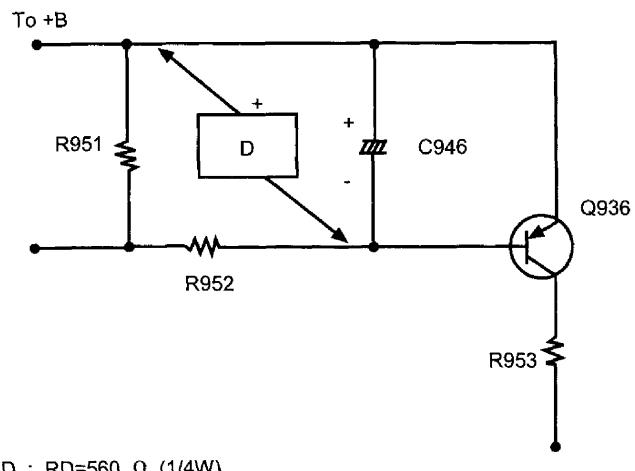

2. PWB (Chassis) Assembly Adjustment

2.1 Memory Initial Adjustment			
Preparation for adjustment		Notes	
(1)	Set the following		
(2)	Set diode "A"		
(3)	Set diode "B"		
(4)	Remove diodes.		

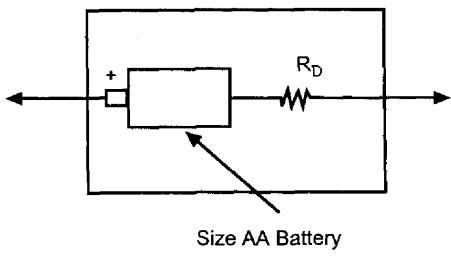

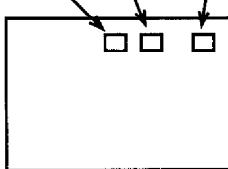

2.2 Power Circuit Adjustment			
2.2.1 +B Adjustment			
Preparation for adjustment		Adjustment procedure	Notes
(1)	Connect power supply PWB assembly to the standard set.	1) Set the voltmeter to both sides of C932.	
(2)	Set AC voltage to $120 \pm 2V$, 60Hz	(2) Heat-Run more than 1 minute.	
(3)	Receive Circle Pattern.	(3) Turn Adjustment Variable Resistor R936 so that +B Voltage value become $220 \pm 1V$	
(4)	Set Brightness to the center and Contrast to the maximum.		

	2.2.2. Operation Check of +B Over-Current Protection Circuit	Adj. point	Q936
Preparation for adjustment		Adjustment procedure	
(1)	Set AC voltage to $120 \pm 2V$	(1) Connect jig D between Emitter and Base of Q936 and check that power turns off and standby mode is set.	Check the voltage of the Battery if it is 1.5V
(2)	Receive Circle Pattern.	(2) Disconnect AC plug.	
(3)	Set Brightness to the center and Contrast to the maximum.	(3) Remove jig D and turn main power on.	

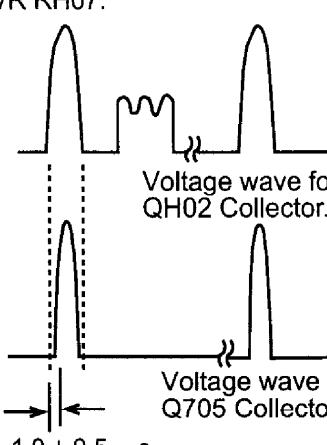

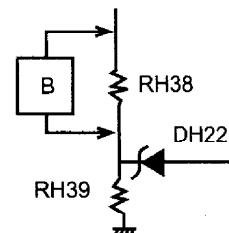

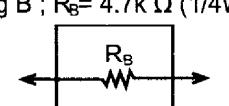

jig D ; RD=560 Ω (1/4W)

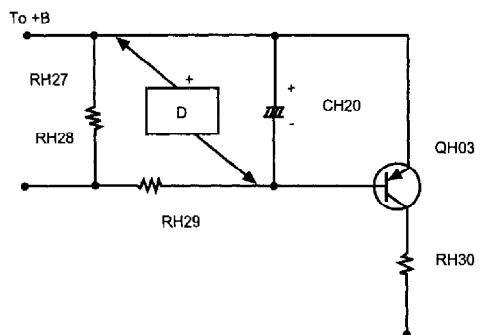

2.3 Deflection Circuit Adjustment			
2.3.1 Chopper Voltage Adjustment			
Preparation for adjustment		Adjustment procedure	Notes
(1) Connect deflection PWB assembly to the standard set. (2) Set AC voltage to $120 \pm 2V$, 60Hz (3) Receive Cross-Hatch and Circle Pattern with White background of VGA3 in group 1. (Horizontal Frequency: 31.5kHz)	(1) Set the Voltage meter to both side of CP20. (2) Leave the set heat-run for more than 30 sec. over. (3) Adjust Chopper Voltage as shown below. (1) VGA of group 1. ↓ (2) DTV ready of group 3. ↓ (3) SVGA of group 1. <u>(1) VGA of group 1</u> Turn the RP09 VR so that Chopper Voltage value is $112 \pm 0.5V$ <u>(2) DTV ready of group 3</u> Turn the RPA2 VR so that Chopper Voltage value is $124 \pm 0.5V$ <u>(3) SVGA of group 1</u> Turn the RPE3 VR so that Chopper Voltage value is $140 \pm 0.5V$ (4) Receive White Signal in DTV Ready of group 3 (Horizontal Frequency: 33.75kHz) or Receive White Signal in PC mode (Horizontal Frequency: 33.75kHz)	<p>SVGA (RPE3) DTV (RPA2) VGA (RP09)</p>  <p>Chopper P.W.B (Parts side View)</p> <p>Set the value of adjustment code D15, H size, to the center, before starting adjustment shown at left.</p> <p>Re-marking after re-adjustment should be as follows. The 2nd time:Red The 3rd time:Blue or Green The 4th time:Change VR</p>	

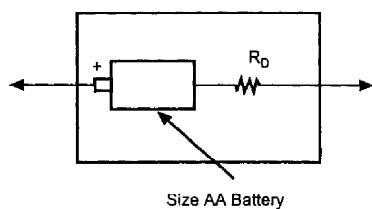

Preparation for adjustment		Adjustment procedure		Notes
(5)	Receive White Raster Signal of SVGA in group 1. (Horizontal Frequency: 37.8kHz)			
(6)	Set Brightness to the center, and Contrast to the maximum.			
2.3.2. High Voltage Adjustment				
(1)	Connect Deflection PWB assembly to the standard set.	1)	Connect High-Voltage meter between FBT anode and CRT GND.	
(2)	Set AC 120±2V, 60Hz.	(2)	Leave the set heat-run for more than 1 minute.	
(3)	Receive White Raster Signal with Circle Pattern of VGA3 in group 1. (Horizontal Frequency: 31.5kHz) (Black line, 100% white back raster)	(3)	Turn High Voltage Adjustment VR, RH69 and then adjust High Voltage to 30.0±0.2kV	Adjustment criterion: ±0.2kV
(4)	Set Brightness to the center, and Contrast to the maximum.			

	2.3.3 High Voltage Phase Adjustment		Adj. point	RH07
	Preparation for adjustment	Adjustment procedure	Notes	
(1)	Receive Cross-Hatch and Circle Pattern with white background of VGA3 in group 1	1) Adjust wave form as shown below with turning High-Voltage Phase Adjustment VR RH07.		
(2)	Set Brightness control to the center, and Contrast control to the maximum.		Both of the probes should be 100 : 1 or 50:1.	
(3)	Connect probe to Collector of Q705 and QH02.	Confirm that the wave form meet adjustment spec. when receiving SVGA of group 1.		
	2.3.4 High Voltage Limiter Operation Check			Adj. point
(1)	Set AC Voltage to $120 \pm 2V$.	1) Connect Jig B between both ends of RH38 and check that power turns off and standby mode is set.		
(2)	Receive Cross-Hatch Signal with Black Lines and 100% White background of VGA3.	2) Disconnect AC plug.		
(3)	Set Brightness and Contrast to the maximum.	3) Remove Jig B and turn the main power on. Check if power is supplied and High Voltage rises.	<p>Jig B ; $R_B = 4.7k \Omega$ (1/4W)</p> 	

	2.3.5 Operation Check of +B Over-Current Protection Circuit		Adj. point	QH03
Preparation for adjustment		Adjustment procedure		Notes
(1)	(1) Set AC voltage to $120 \pm 2V$.		(1) Connect jig D between Emitter and Base of QH03, then check if power turns off and Standby mode is set.	Check the voltage of the battery if it is 1.5V
(2)	(2) Receive Cross-Hatch Signal of VGA3 with Black Line and 100% White background.		(2) Disconnect AC plug.	
(3)	(3) Set Brightness and Contrast to the maximum.		(3) Remove jig D and turn main power on.	

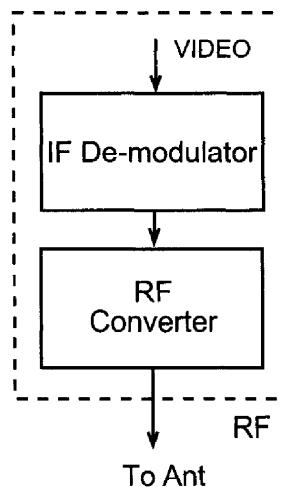

jig D ; $R_D = 560 \Omega$ (1/4W)

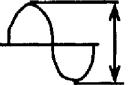

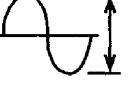

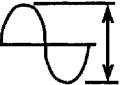

2.4 AFC Operation Check			
Preparation for adjustment		Adjustment procedure	Notes
(1) Connect Jig to the Antenna Terminal as shown below.		(1) Select Main Picture. (2) Receive standard signal, which isn't offset, by channel up/down or direct selection buttons. Check if it is pulled in the standard tuning point. (3) Receive +1.5MHz offset signal. Check if it is pulled in the standard tuning point. (4) Receive -1.5MHz and offset signal. Check that it is pulled in the standard tuning point.	1) Use Circle Pattern or Color Bar signal when modulating.

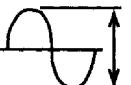

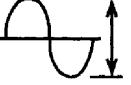

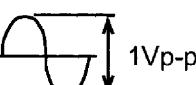

Checking Jig : all channel converter is appropriate.

2.5 Audio Operation Check

2.5.1 MTS Operation Check				
2.5.1.1 Stereo/SA Broadcast Receiving Check				
Preparation for adjustment		Adjustment procedure		Notes
(1)	Receive Stereo Broadcast.	1)	Stereo Broadcast receiving check. 1) Select STEREO mode. 2) Check L channel sound from left speaker when only L channel is broadcasting. 3) Check R channel sound from right speaker when only R channel is broadcasting. 4) Check both left and right channel sound from both speakers when monaural is broadcasting.	
(2)	Receive Second Audio Program, then select it.	(2)	Second Audio Program broadcast receiving check. 1) Select Second Audio Program mode. 2) Check if you can hear the Second Audio Program from both left and right speakers. 3) Check if you can hear the main sound when receiving no Second Audio Program.	<ul style="list-style-type: none"> • Select "Stereo/SAP" alternately • Check if "ST" OSD appears below the Channel OSD, for approx. 8 sec when you select Channel or Recall Button is pressed.
(3)	Set Balance to the center.			
2.5.1.2 STEREO Separation Check.				
Preparation for adjustment		Adjustment procedure		Notes
(1)	Receive Stereo or Second Audio Program Broadcast.	1)	Check if there is more than 15dB out difference between L channel and R channel when receiving stereo signal.	When receiving broadcast with only L channel audio. (30% modulation f=400Hz)
(2)	Set Surround off. 1) SRS 2) BBE			
(3)	Select Stereo mode.			
(4)	Connect probe with Audio out terminal L and R.			

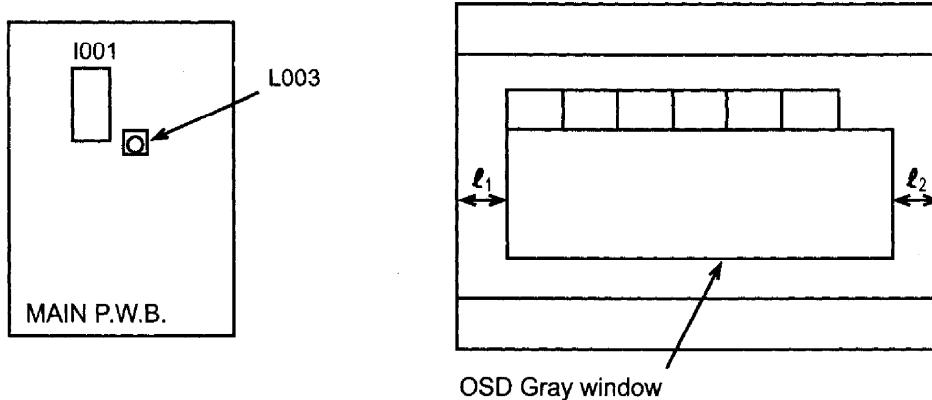

2.5.2 SRS Operation Check				
Preparation for adjustment		Adjustment procedure		Notes
(1) Set Audio settings as follows.		(1) Check if HiFi output L channel meets the following wave form on signal ①.		
Balance : TYP Bass : TYP Treble : TYP Loudness : OFF BBE : OFF		(a) SRS : OFF	0	HiFi (L) out
(2) Input signal to the VIDEO INPUT R terminal with SRS mode 3D STEREO, or L/Mono terminal with SRS mode 3D Mono, as follows. ① SRS mode 3D Stereo Rch : 400Hz 1Vp-p Lch : No signal ② SRS mode 3D Mono Rch : 200Hz 1Vp-p Lch : 200Hz 1Vp-p		(b) SRS : 3D STEREO	0.7 Vp-p±0.2	
(3) Set Volume 40 steps.		(2) Check if HiFi output L channel meets the following wave form on signal ②.		
		(a) SRS : OFF	0.6Vp-p±0.2	
		(b) SRS : 3D STEREO	0.8Vp-p±0.2	

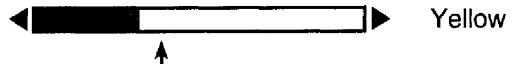

2.5.3 BBE Operation Check			
Preparation for adjustment		Adjustment procedure	Notes
(1) Set Audio settings as follows. Balance : TYP Bass : TYP Treble : TYP Loudness : OFF SRS : OFF	(1)	Check if the following wave form output at HiFi output (L). (a) BBE : OFF  (b) BBE : ON 	0.6Vp-p±0.2 0.9Vp-p±0.2
(2) Input signal to L/Mono terminals at video input as follows. L/Mono channel 100Hz 1Vp-p			
(3) Set Volume 40 steps.			

RF signal	MTS mode		
	MONO	Stereo	Second Audio Program
AUDIO MODE			
Normal	12	12	12
Stereo	12	STEREO 12 ST	STEREO 12 ST
Second audio program	12	STEREO 12 SA	SAP 12 SA
STEREO +SAP	12	STEREO 12 ST/SA	SAP 12 ST/SA

	2.6 OSD Check		
2.6.1 OSD Position Check			
	Preparation for adjustment		Notes
(1)	Receive Circle Pattern.	(1) Press MENU button.	
(2)	Set Video settings normal condition; center.	(2) Check if the lower blue rectangle meet 3.5 ± 1 of scale on Circle Pattern as follows. (3) Check if Colored Bar meet 4.5 ± 1 of scale on the Circle Pattern as follows.	
<p style="text-align: center;"><u>Left edge of the Menu (The 1st layer)</u></p> <p style="text-align: center;">OSD position spec.</p> <p style="text-align: center;">$XL=5.0 \pm 1.0$ $XR=5.0 \pm 1.0$</p> <p style="text-align: center;">Colored Bar</p> <p style="text-align: center;">X (Size marker)</p>			

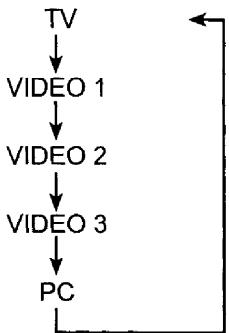

2.6.2 OSD Size Adjustment			
Preparation for adjustment		Adjustment procedure	Notes
(1) Receive DTV (1080i) signal	(1)	<p>Press MENU button.</p> <p>(2) Adjust L003 so that OSD size becomes as follows. $l_1 - l_2 \leq 5\text{mm}$</p>	

	2.7 Remote Operation Check		
	2.7.1 Direct Channel Selection		
	Preparation for adjustment	Adjustment procedure	
(1)	Input channel number by using "0" to "9" buttons.	(1)	Check if input number coincides displayed channel number, and also the picture coincides the channel number.
	2.7.2 LST-CH		
		(1)	Check if channel immediately changes alternately every time LST-CH button is pressed.
	2.7.3 MUTE		
		(1)	<p>Check if sound alternates between mute and normal every time MUTE button is pressed.</p> <p>VOLUME 24 : Green</p>  <p>MUTE 24 : Magenta</p> 
	2.7.4 RECALL		
		(1)	Check if On-Screen Display appears and disappears alternately every time RECALL button is pressed.

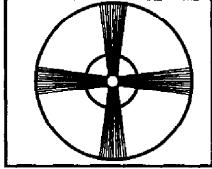

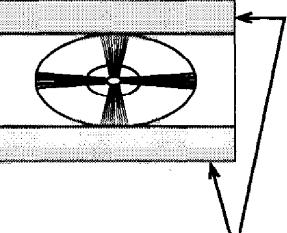

2.8 PC Control Operation Check			
Preparation for adjustment		Adjustment procedure	Notes
(1) Select PC mode	(1)	Press cursor button of the remote handset.	
(2) Confirm that there is no check mark of "keyboard use" on Set Up Menu OSD.	(2)	Check if the pointer of the windows is moving.	General check If there is a check mark at Keyboard Use Menu, press right cursor button to release.
(3) Connect PC and TV with Mini DIN 6P cable for PC control. Note: Windows 3.1 or 95 should be working on PC. Use PC which has Hot Plugging on mouse operation. Recommended PC : Think Pad 365XD	(3)	Check if speed of the pointer changes when pressing the cursor button continuously.	Speed control check.

	2.9 Selection Operation Check										
	2.9.1 Power										
	Preparation for adjustment		Adjustment procedure		Notes						
(1)	Set VHF/UHF/CATV signal.		(1)	Power should alternate between On and Off every time power button is pressed.							
	2.9.2 Channel UP/DOWN										
			(1)	Check if receiving VHF, UHF, and CATV every time CHANNEL Up (\blacktriangle) or CHANNEL Down (∇) buttons is pressed.							
				<ul style="list-style-type: none"> Check if On-Screen Display appears which corresponded to the receiving broadcast. Antenna indication color. <table border="1"> <tr> <td>Antenna</td> <td>CHANNEL display color</td> </tr> <tr> <td>Antenna</td> <td>Green</td> </tr> <tr> <td></td> <td></td> </tr> </table>		Antenna	CHANNEL display color	Antenna	Green		
Antenna	CHANNEL display color										
Antenna	Green										
	2.9.3 Volume UP/DOWN										
			(1)	Volume should increase or decrease continuously every time VOLUME UP (\blacktriangle) or VOLUME Down (∇) buttons is pressed.							
				Check that the On-Screen Display changes.							
				 VOLUME : Green							

2.9.4 Input Selection			
Preparation for adjustment		Adjustment procedure	Notes
		<p>1) Check if signal and OSD change in the following sequence every time INPUT button is pressed.</p> 	<ul style="list-style-type: none"> Check if the contents of the picture meets OSD. OSD, "S-IN", appears when using S-input on video 1, 2 and Video 3. OSD, "Y-CBCR", appears when using Y-C_B C_R INPUT on component input at Video 2. OSD "Y-PBPR" appears when using Y-PBPR input on component input at Video 2.
2.9.5 Clock Set			
(1)	Initial set-up mode.	<p>(1) Select Initial set up mode with ▲▼ buttons. (2) Select clock setting with ▲▼ buttons. (3) Then press ► button to set clock. (4) Set clock with using the ▲▼► button, then the clock starts when pressing ◀ key to return to clock set mode. (5) Connect D025 between pin 20 and pin 32 of 1001. (6) Check if clock OSD appears by pressing RECALL button. Then, clock OSD runs 60 times faster.</p>	<ul style="list-style-type: none"> Diode D025 helps to check the operation with 60 times faster.

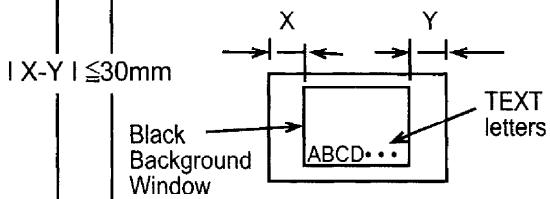

2.10 External in / out Operation			
2.10.1 AV in / out Signal Check			
Preparation for adjustment		Adjustment procedure	Notes
(1) Input signal to the V and L/R terminals of input 1.	(1)	External input check. 1) Check Picture and Audio of Video 1	<ul style="list-style-type: none"> S-Input has a priority on VIDEO 1, 2, and 3.
(2) Input signal to the S-input terminal of input 1.		2) Check Picture at S-input of Video 1.	<ul style="list-style-type: none"> Y P_B/C_B P_R/C_R has a priority on VIDEO 2. You hear both L and R channels together with only L terminal input.
(3) Input signal to the V and L/R terminals of input 2.		3) Check Picture and Audio of Video 2	<ul style="list-style-type: none"> Check VIDEO mode.
(4) Input signal to the S-input terminal of Input 2.		4) Check Picture and Audio at S-input of video 2.	<ul style="list-style-type: none"> Check if bass, treble, balance, volume, mute, and surround work.
(5) Input signal to the Y P _B /C _B P _R /C _R Input terminal of INPUT 2.		5) Check Picture and Audio at Y P _B /C _B P _R /C _R of Video 2.	
(6) Input signal to the S-input terminal of Input 3.		6) Check Picture of S-input of Video 3.	<ul style="list-style-type: none"> Refer to the Surround Operation Check in detail.
(7) Input signal to the V and L/R terminals of Input 3.		7) Check Picture and Audio of Video 3	
(8) Receive Circle Pattern.	(2)	External output check. 1) Check Picture and Audio can be monitored.	
(9) AUDIO to HiFi terminal.		2) Check Audio from speakers.	

2.10.2 Terminal Priority Check				
Preparation for adjustment		Adjustment procedure		Notes
	<u>VIDEO 1 / VIDEO 3</u>			
(1)	Input signal "A" to the Video terminal of input 1, then input the signal "B" to S terminal of INPUT 1	(1)	Check picture at S-input of VIDEO 1 and VIDEO 3 with signal "B".	Use the different signal between A and B.
(2)	Remove signal "B" of INPUT 1 and INPUT 3 S-terminal.	(2)	Check picture at S-input of VIDEO 1 and VIDEO 3 with signal "A".	
	<u>VIDEO 1 / VIDEO 2</u>			
(3)	Input signal "A" to the VIDEO terminal of INPUT 2. Input signal "B" to the S-terminal of INPUT 2. Then, input signal "C" to the Y/CB/CR terminals.	(3)	Check picture at Y/CB/CR with signal "C".	Use the different signal between A, B, and C.
(4)	Remove signal "C" of Y/CB/CR terminal.	(4)	Check that the picture of VIDEO 2. Signal "B" for S input, can be monitored.	
(5)	Remove signal "B" of S-terminal at INPUT 2.	(5)	Check picture of VIDEO 2. with signal "A".	
2.10.3 Component Input Operation Check				
Preparation for adjustment		Adjustment procedure		Notes
(1)	Prepare signal Y P _B /C _B P _P /C _R at COMPONENT terminal. (f _H ;15.73kHz, 31.5kHz, 33.75kHz).	(1)	Check picture.	
(2)	Input signal with 15.73kHz to COMPONENT terminal.	(2)	Check if Vertical Size changes by remote handset.	
		(3)	Check if vertical size changes with the same procedure as well at 31.5kHz, 33.75kHz.	 Black Area

2.10.4 PC Input Operation Check			
Preparation for adjustment		Adjustment procedure	Notes
(1) Input sound to the Stereo Jack terminal. (2) Input signal to the rear D-Sub terminal. (3) Change the D-Sub terminal input by menu. (4) Then, input signal to the front of the D-Sub terminal. (5) Change signal to the rear of the D-Sub terminal by MENU.	(1)	Check picture and audio. (2) Check picture and audio.	
2.10.5 P in PC Operation Check			
Preparation for adjustment		Adjustment procedure	Notes
(1) Input Color Bar Signal to RF terminal. (2) Input Cross-Hatch Signal of VGA3, VGA4 and SVGA to the rear of the D-sub terminal. (3) Select PC mode. (4) Press P in PC key of the Remote handset.	(1) (2) (3) (4)	Check if the size of window on TV picture changes, when pressing the PiPC button of the remote handset. Check if the window on TV picture moves to the Left and Right, when pressing cursor left and buttons of the remote handset. Check if the sound is changing of TV and PC by pressing up and down cursor buttons of the remote handset. Check the same operation check for the front D-Sub terminal.	

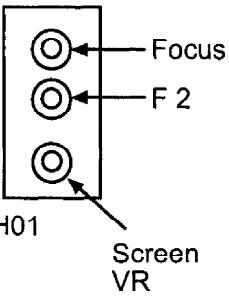

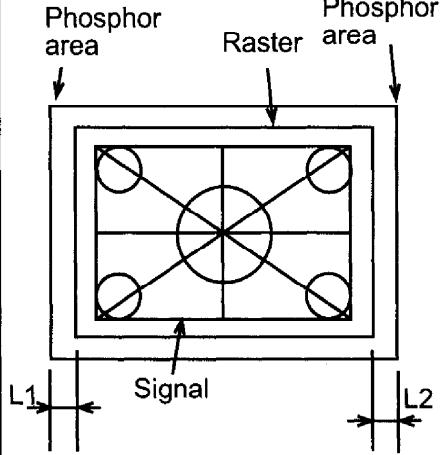

2.10.6 CATV Check			
Preparation for adjustment		Adjustment procedure	Notes
(1) Select Signal source of Set-up menu.		(1) Select set-up menu by pressing up and down cursor buttons. (2) Select signal source option by pressing up and down cursor buttons. (3) Check if signal source change between antenna, CATV 1, and CATV 2 by pressing right cursor button. Check if broadcast coincides to OSD.	
2.10.7 Closed Caption Check			
Preparation for adjustment		Adjustment procedure	Notes
(1) Press MENU, then select CUSTOMIZE option with ▼▲ buttons. (2) Press ► button, then select CLOSED CAPTION with ▼▲ buttons. (3) Press ► button, then select CLOSED CAPTION mode. (4) The DISPLAY mode should set ON with ► button. The MODE should be set C.C. with ► button. The CHANNEL mode should set 1 with ► key. (5) Set CHANNEL to 2. (6) Set CHANNEL to 1. (7) Set MODE to TEXT. (8) Repeat steps (5) to (7). (9) Set MODE to C.C. (10) Set DISPLAY to OFF.		(1) Check that CAPTION appears on the screen according to the settings. (2) The CAPTION of CHANNEL 2 appears on the screen. (3) Check that the CAPTION of CHANNEL 1 (Field 2) appears on the screen. (4) Check that a Black Window appears and TEXT letters appear at the center of the screen. (5) Check if TEST letters appear. (6) The Black Window should disappear. (7) Check if the CAPTION letters disappear.	Receive signal which is encoded Closed Caption. * Read error should not occur on each mode. Errors of Closed Caption 1. Wrong letters appear. 2. Missing letters. 3. Other abnormal display.

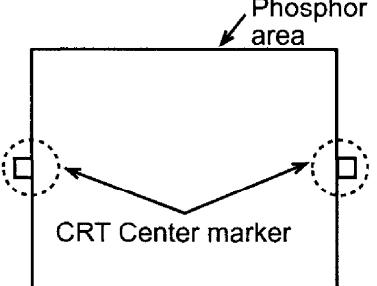

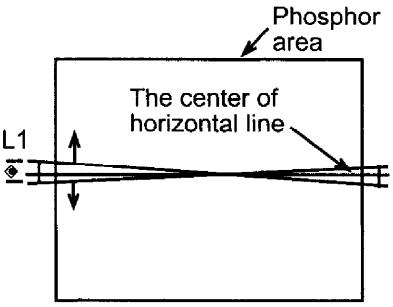

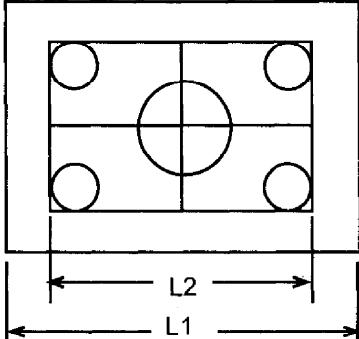

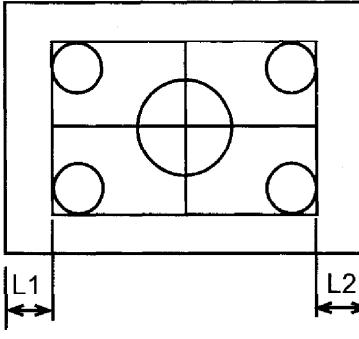

2.10.8 DPMS			
Preparation for adjustment		Adjustment procedure	Notes
(1)	Set AC to 120±2V, 60Hz.		
(2)	Receive Cross-Hatch signal of VGA3 on group 1 at PC mode.	(1) Check picture, then check that the color of LED is green.	
(3)	Remove Horizontal Sync.	(2) Check that the high voltage of deflection shuts down. Heater voltage should be 6.3V±0.2V, then the color of LED is orange.	
(4)	Remove Vertical Sync.	(3) Check that high voltage of deflection shuts down. Check that heater voltage becomes 0V, then the color of LED becomes orange.	
(5)	Remove Horizontal and Vertical Sync.	(4) Check if High voltage of deflection shuts down. Check that heater voltage becomes 0V, then the color of LED becomes orange.	
(6)	Re-input Horizontal or Vertical sync in (3), (4), (5).	(5) Check that the set turns on after re-input of Horizontal or Vertical synchronous signal.	

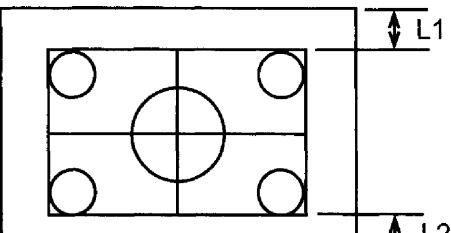

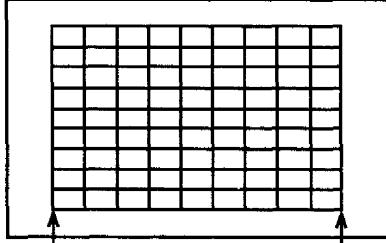

3. Final Assembly adjustment

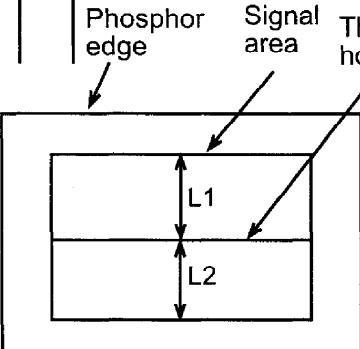

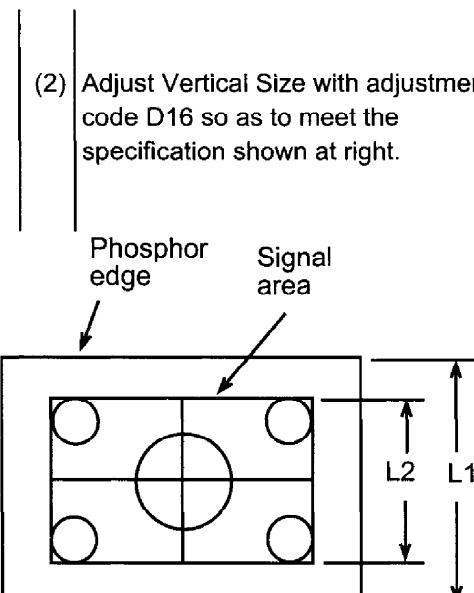

3.1 Deflection system adjustment (Picture display position and size adjustment)			
Preparation for adjustment		Adjustment procedure	Notes
		(1) Perform each deflection adjustment item. Adjust by I ² C command.	This TV is compatible with 8 resolution patterns. Perform deflection adjustment for each resolution pattern. The group corresponding to the resolution pattern Group 1 :PC Mode <u>VGA3</u> (640x480 Under scan) <u>VGA4</u> (640x480 Under scan) <u>SVGA</u> (800x600 Under scan) Group 2 :TV Mode Group 3 :Component Mode • Monitor will discriminate resolution pattern from the input polarity of sync signal, and write adjustment data in memory area corresponding to the resolution pattern when receiving save command. However, for Group 3. Set should face to East-West direction during adjustment. If not, use artificial magnetic field.
(1)	Turn power on, then heat-run for 20 minutes or more.		
(2)	Input signal which resolution is adjusted.		
(3)	Coarse adjust screen and Focus.		

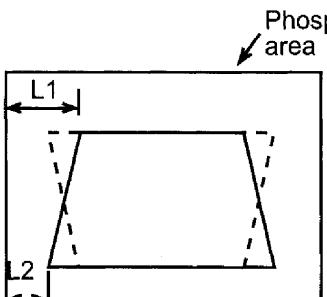

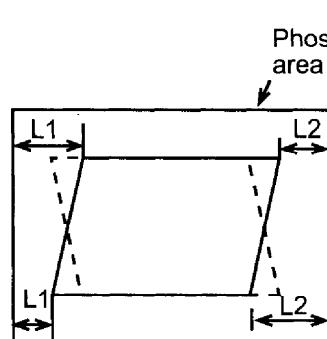

3.1.1 Deflection System Adjustment in PC Mode. 3.1.1.1 Horizontal Raster Center Adjustment		Adj. point	R741							
Preparation for adjustment		Adjustment procedure		Notes						
(1) Receive Cross-Hatch and Circle Pattern with Black background of VGA3 in group 1. Set Contrast and Bright to the maximum so that raster is visible. Do this item at the beginning of final adjustment.	(1) Turn screen VR so that the raster appears slightly. (2) Factory adjustment data Set D15, Horizontal Size, to 20 with user data center (3) Turn the R741 VR so that size of L1 and L2 at left and right in diagram below are equal. (4) Set process 1 and 2 to the previous condition.	(1) Turn screen VR so that the raster appears slightly. (2) Factory adjustment data Set D15, Horizontal Size, to 20 with user data center (3) Turn the R741 VR so that size of L1 and L2 at left and right in diagram below are equal. (4) Set process 1 and 2 to the previous condition.	The position of screen VR							
			<table border="1"> <tr> <td></td><td>Unit :mm</td></tr> <tr> <td>Model</td><td>IL1-L2I</td></tr> <tr> <td>36SDX88B</td><td>3.0</td></tr> </table>			Unit :mm	Model	IL1-L2I	36SDX88B	3.0
	Unit :mm									
Model	IL1-L2I									
36SDX88B	3.0									
										

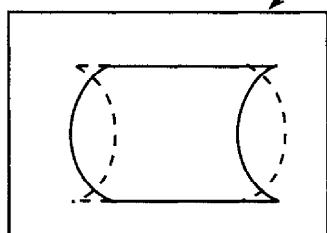

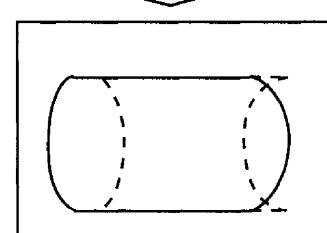

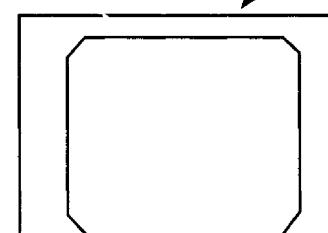

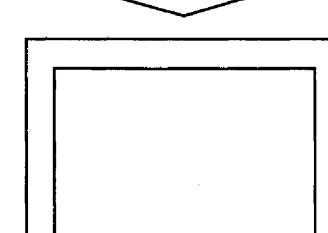

3.1.1.2 Tilt and V Position Adjustment		Adj. point	D15, D18				
Preparation for adjustment		Adjustment procedure					
(1) Receive Cross-Hatch signal with Black Back ground of VGA3 in group 1.	(1) Select D15, H Size, of adjustment code. (2) Set data of D15 to more than 35 until CRT center marker can be visible.	Adjust Tilt and V Position on VGA4 and SVGA as well with the same way.					
	 <p>(3) Adjust D17 so that the center of horizontal line meet CRT center marker</p>  <p>(4) Adjust Tilt of both CRT center markers and the center of horizontal line with D18 of adjustment code.</p>	<p>Adjustment criterion</p> <table border="1"> <tr> <th>Model</th> <th>L1</th> </tr> <tr> <td>36SDX88B</td> <td>$\leq 2.0\text{mm}$</td> </tr> </table>	Model	L1	36SDX88B	$\leq 2.0\text{mm}$	
Model	L1						
36SDX88B	$\leq 2.0\text{mm}$						

	3.1.1.3 Horizontal Size and Position Adjustment		Adj. point	D13,D15												
Preparation for adjustment		Adjustment procedure		Notes												
(1)	Receive Cross-Hatch and Circle Pattern of VGA1 in group 1 with White Background.	(1)	Select Horizontal Size of factory adjustment and adjust so that Horizontal Size is L2 value shown in Table below. Factory adjustment No. :D15 (H-Size) 	Adjust VGA4, SVGA by the same way.												
(2)	Focus adjustment should be finished in advance.	(2)	Do this adjustment and Horizontal center adjustment together in case of adjustment. Select Horizontal Position of factory adjustment adjust so that size of L1 and L2 at the top and bottom in diagram below are equal. Factory adjustment No. :D13. 	<p style="text-align: right;">(unit :mm)</p> <table border="1"> <thead> <tr> <th>Model</th> <th>L1</th> <th>L2</th> </tr> </thead> <tbody> <tr> <td>36SDX88B</td> <td>721.4</td> <td>671 ± 3</td> </tr> </tbody> </table> <p style="text-align: right;">(93% of active area)</p> <p>Do this adjustment and Horizontal size adjustment together in case of adjustment.</p> <table border="1"> <thead> <tr> <th>Model</th> <th>(unit :mm)</th> </tr> </thead> <tbody> <tr> <td></td> <td>IL1-L2I</td> </tr> <tr> <td>36SDX88B</td> <td>≤ 3.0</td> </tr> </tbody> </table>	Model	L1	L2	36SDX88B	721.4	671 ± 3	Model	(unit :mm)		IL1-L2I	36SDX88B	≤ 3.0
Model	L1	L2														
36SDX88B	721.4	671 ± 3														
Model	(unit :mm)															
	IL1-L2I															
36SDX88B	≤ 3.0															

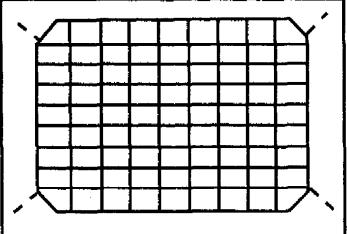

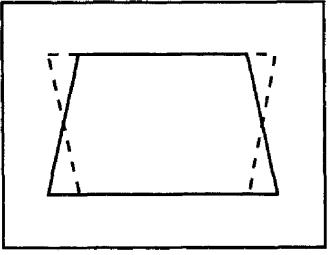

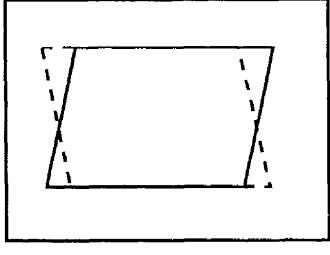

3.1.1.4 Vertical Linearity, Size and Position Adjustment		Adj. point	D17
Preparation for adjustment		Adjustment procedure	
		(3) Adjust D17 of adjustment code, V position, so that L1 and L2 are equal as shown below. 	
		(unit :mm) Set name IL1-L2I 36SDX88B ≤ 3.0	
3.1.1.5 Vertical Pincushion Adjustment		Adj. point	D14
Preparation for adjustment		Adjustment procedure	
(1) Adjust Vertical Pincushion adjustment after adjust vertical size.	(1)	Select Vertical pincushion of factory adjustment adjust so that vertical lines, shown by arrow, at left and right sides become straight. Factory adjustment No. :D14 	
(2) Receive the Cross-Hatch signal of VGA3 in group 1 with Black Background.	(2)	If adjustment is difficult with D14, adjust the following items as well. Trapezoid adjustment : see 3.1.1.6 Pincushion balance : see 3.1.1.8 Corner adjustment : see 3.1.1.9 Parallelogram adjustment : 3.1.1.7	
(3) Contrast: maximum Brightness: center			

	3.1.1.4 Vertical Linearity, Size and Position Adjustment		Adj. point	D11, D16																		
Preparation for adjustment		Adjustment procedure		Notes																		
(1)	Receive Cross-Hatch and Circle Pattern of VGA3 in group 1 with White Background.	(1) Adjust Vertical Linearity with adjustment code, D11 so that the length of upper area L1 and lower area L2 to be equal.	Adjust VGA4, SVGA by the same way.																			
(2)	Focus adjustment should be finished in advance.	 <p>(2) Adjust Vertical Size with adjustment code D16 so as to meet the specification shown at right.</p> 	<table border="1"> <thead> <tr> <th colspan="3">(unit :mm)</th> </tr> <tr> <th>Model</th> <th>L1-L2</th> <th> L1-L2 </th> </tr> </thead> <tbody> <tr> <td>36SDX88B</td> <td>251.5</td> <td>≤ 2 ± 3</td> </tr> </tbody> </table> <table border="1"> <thead> <tr> <th colspan="3">(unit :mm)</th> </tr> <tr> <th>Model</th> <th>L1</th> <th>L2</th> </tr> </thead> <tbody> <tr> <td>36SDX88B</td> <td>541.0</td> <td>503± 3</td> </tr> </tbody> </table>	(unit :mm)			Model	L1-L2	L1-L2	36SDX88B	251.5	≤ 2 ± 3	(unit :mm)			Model	L1	L2	36SDX88B	541.0	503 ± 3	
(unit :mm)																						
Model	L1-L2	L1-L2																				
36SDX88B	251.5	≤ 2 ± 3																				
(unit :mm)																						
Model	L1	L2																				
36SDX88B	541.0	503 ± 3																				

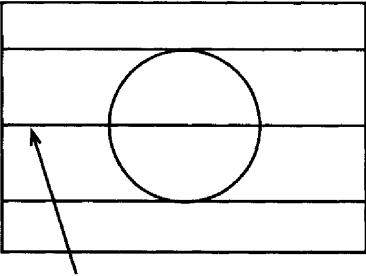

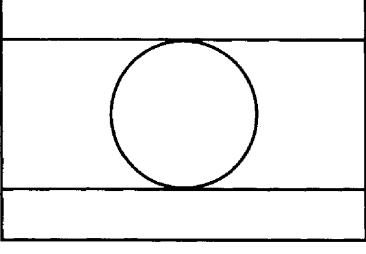

3.1.1.6 Trapezoid Adjustment (if necessary)		Adj. point	D09				
Preparation for adjustment		Adjustment procedure					
(1) Receive Cross-Hatch Pattern in group 1.	(1) Adjust Trapezoid with adjustment No. D09 so that L1 and L2 become equal if there is a difference between L1 and L2.	Adjust VGA4 and SVGA as well by the same way.					
	 <p style="text-align: right;">unit :mm</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <tr> <td style="padding: 2px;">Model</td> <td style="padding: 2px;"> IL1-L2 </td> </tr> <tr> <td style="padding: 2px;">36SDX88B</td> <td style="padding: 2px;">$\leq 3.0\text{mm}$</td> </tr> </table> <p><u>Adjust Trapezoid and Parallelogram together.</u></p>	Model	IL1-L2	36SDX88B	$\leq 3.0\text{mm}$		
Model	IL1-L2						
36SDX88B	$\leq 3.0\text{mm}$						
3.1.1.7 Parallelogram Adjustment (if necessary)		Adj. point	D07				
(1) Receive Cross-Hatch pattern in group 1.	(1) Adjust Parallelogram with adjustment No. D07 so that L1 and L2 become equal if there is a difference between L1 and L2.	Adjust VGA4 and SVGA as well by the same way.					
	 <p style="text-align: right;">unit :mm</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <tr> <td style="padding: 2px;">Model</td> <td style="padding: 2px;"> IL1-L2 </td> </tr> <tr> <td style="padding: 2px;">36SDX88B</td> <td style="padding: 2px;">$\leq 3.0\text{mm}$</td> </tr> </table> <p><u>Adjust Trapezoid and Parallelogram together.</u></p>	Model	IL1-L2	36SDX88B	$\leq 3.0\text{mm}$		
Model	IL1-L2						
36SDX88B	$\leq 3.0\text{mm}$						

	3.1.1.8 Pincushion Balance (if necessary)		Adj. point	D06
	Preparation for adjustment	Adjustment procedure	Notes	
(1)	Receive Cross-Hatch Pattern of VGA3 in group 1.	(1) Adjust Pincushion Balance with adjustment No. D06 so that left and right side of pincushion become equal if it's not good enough. Phosphor area  	Adjust VGA4 and SVGA as well by the same way.	
	3.1.1.9 Corner Adjustment (if necessary)		Adj. point	D08
	Preparation for adjustment	Adjustment procedure	Notes	
(1)	Receive Cross-Hatch Signal of VGA3 in group 1 with Black Background.	(1) Adjust Corner with adjustment no. D08 so that left and right end of the corner at the vertical line on Cross-Hatch become straight if it bends. Phosphor area  	Adjust VGA4, SVGA by the same way.	

	3.1.2 Deflection System Adjustment in TV Mode 3.1.2.1 Size, Position, and Tilt Adjustment	Adj. point	D13, D15 D17, D18				
Preparation for adjustment		Adjustment procedure					
(1)	Receive Circle Pattern. Contrast : Maximum Brightness : Center	(1) Adjust Horizontal Size and Postition with adjustment code D15 so that CRT center marker is completely visible.	Adjust Tilt and Vertical position as well on DTV mode in group 3.				
			<p style="text-align: right;">center</p> <p style="text-align: right;">The center of horizontal lines</p>				
		(2) Adjust Tilt with adjustment code D18 so that the center horizontal line of Circle Pattern meet the specification as shown the right.	<p style="text-align: right;">Unit : mm</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <tr> <td style="padding: 2px;">Model</td> <td style="padding: 2px;">L1</td> </tr> <tr> <td style="padding: 2px;">36SDX88B</td> <td style="padding: 2px;">2.0</td> </tr> </table>	Model	L1	36SDX88B	2.0
Model	L1						
36SDX88B	2.0						
							
		(3) Adjust Vertical Position with adjustment code D17 so that the center horizontal line of Circle Pattern enters CRT center marker.					
		(4) Adjust Horizontal Size with adjustment code D15 so that Horizontal Size marker of Circle Pattern become 0.5, -0.3 / +0.5. Adjust Horizontal Position with adjustment code D13 so that both left and right Horizontal Size markers become equal.					
		(5) Repeat item (4) until specifications is met.					

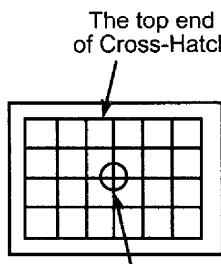

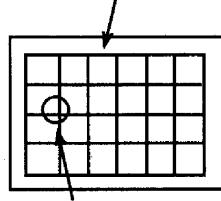

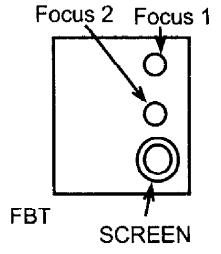

Preparation for adjustment	Adjustment procedure	Notes
	<p>b) Corner Distortion Adjustment</p> 	Adjustment code : D08
	<p>c) Trapezoid Adjustment</p> 	Adjustment code : D09
	<p>d) Parallelogram Adjustment</p> 	Adjustment code : D07

	3.1.3 Deflection System Adjustment in DTV Mode		Adj. point	D13, D15				
	3.1.3.1 Tilt and Vertical Position Adjustment			D17, D18				
	Preparation for adjustment	Adjustment procedure		Notes				
		(1)	Refer to 3.1.2.1 Horizontal Size, Vertical Size and Position adjustment.					
	3.1.3.2 Horizontal Size Position Adjustment		Adj. point	D13, D15				
	Preparation for adjustment	Adjustment procedure		Notes				
(1)	Receive 1080i Circle Pattern No. 59 of DTV signal generator made by Leader.	(1)	Adjust Horizontal Size with adjustment code D15 so that CRT center marker is completely visible.					
(2)	Contrast : Maximum Brightness : Center	(2)	Adjust Horizontal Size and position with adjustment code D15 and D13 as shown below.					
 <p>L1 : Adjust Horizontal Size so that there are $9.0_{+0.3}^{-0.1}$ squares between horizontal center and phosphor edge.</p>								
<table border="1"> <tr> <td>Model</td> <td>L1(squares)</td> </tr> <tr> <td>36SDX88B</td> <td>$9_{+0.3}^{-0.1}$</td> </tr> </table>		Model			L1(squares)	36SDX88B	$9_{+0.3}^{-0.1}$	
Model	L1(squares)							
36SDX88B	$9_{+0.3}^{-0.1}$							

3.1.3.3 Vertical Size Adjustment		Adj. point	D11, D16				
Preparation for adjustment		Adjustment procedure					
(1) Receive 1080i Circle Pattern No. 59 of DTV signal generator made by Leader. (2) Contrast : Maximum Brightness : Center	(1) Adjust Vertical Linearity with adjustment code D11 so that L1 and L2 become equal.	 <p>The center of horizontal lines</p>	<p>Unit : mm</p> <table border="1"> <tr> <td>Model</td> <td> L1-L2 </td> </tr> <tr> <td>36SDX88B</td> <td>3.0</td> </tr> </table>	Model	L1-L2	36SDX88B	3.0
Model	L1-L2						
36SDX88B	3.0						
	(1) Adjust Vertical Size with adjustment code D16 so as to meet specification.		<p>Unit : mm</p> <table border="1"> <tr> <td>Model</td> <td>L</td> </tr> <tr> <td>36SDX88B</td> <td>495±3</td> </tr> </table>	Model	L	36SDX88B	495±3
Model	L						
36SDX88B	495±3						

	3.1.3.4 Other Geometry Adjustment		Adj. point	D14, D06 ~D09				
Preparation for adjustment		Adjustment procedure		Notes				
(1) Vertical Size and Position adjustment should be finished in advance. (2) Receive 1080i Circle Pattern No. 59 of DTV signal generator made by leader. (3) Contrast : Maximum Brightness : Center	(1)	<p>Adjust Vertical Pincushion with adjustment code D14 so that the second vertical line from left and right end, shown by arrow in the figure, become straight.</p>  <p>(2) Adjust the following adjustment if it does not meet specification.</p> <p>a) Vertical Pincushion Balance</p>  <p>b) Corner Distortion Adjustment</p> 	<p>Unit : mm</p> <table border="1"> <tr> <td>Model</td> <td>IL1-L2I</td> </tr> <tr> <td>36SDX88B</td> <td>3.0</td> </tr> </table>		Model	IL1-L2I	36SDX88B	3.0
Model	IL1-L2I							
36SDX88B	3.0							
<p>Adjustment code : D06</p> <p>Adjustment code : D08</p>								

Preparation for adjustment		Adjustment procedure		Notes	
		c)	Trapezoid adjustment 	Adjustment code : D09	
		d)	Parallelogram adjustment 	Adjustment code : D07	
		3.2 Cut-off Coarse Adjustment			Adj. point
Preparation for adjustment		Adjustment procedure			Notes
(1) Connect probe of the oscilloscope to pin 1 of ECT connector on CPT PWB. (2) Set vertical deflection stop in a beeline.		(1) Change IIC data of adjustment No. P05 so that the voltage of ECT connector pin 1 become the same voltage as shown below. (2) Write same data of adjustment No. P05 to No. P06 and No. P07 after finish adjustment item 1.	 $V=3.1 \pm 0.05\text{Vdc}$	Release vertical deflection stop in a beeline after adjustment. Begin cut-off adjustment on this data as a start which is written here when final adjustment.	

	3.3 Focus Adjustment	Adj. point	FOCUS 1 FOCUS 2
Preparation for adjustment		Adjustment procedure	Notes
(1) Do this adjustment after adjusting horizontal and vertical center and size is finished. Picture :Standard factory settings (2) AC120V±2V (3) Receive Cross-Hatch Signal with Circle Pattern. VGA3 group 1 Black background White line (4) Adjust cut-off after finishing coarse Focus adjustment; Just Focus is ±200V. Confirm Cut-Off Adjustment if voltage range is out of ±200V after re-adjusting Focus.	(1) Turn picture adjust VR. Change Sub-Brightness Data at adjustment No. 10 so that background become just black if it's too bright or too dark. (2) Horizontal Line Adjustment Adjust Focus on Cross-Hatch Circle Pattern concentrating the center point of the picture. (3) Adjust focus while focusing only at horizontal line so that it become the thinnest without any halo and blooming on the horizontal line. The focus point is center. (4) Adjust focus so that there is no halo and blooming on the horizontal and vertical lines with repeating from item 2 to 5. Final process should be item 5 of this page. (5) Vertical Line Adjustment Adjust Focus on Cross-Hatch Circle Pattern focusing the point as shown in the right figure. (6) Adjust focus 2, focusing only at vertical line so that it become the most thick; the adjustment point which can be seen the clearest without any saturation. Concentration point: Inner point of the circle as shown in the right figure. Note: Adjust Horizontal Center Focus again after adjusting Vertical Focus.	There are 2 Focus adjustment VRs at FBT, TH01, on Deflection PWB, because this chassis uses Double Focus System. A criteria of Focus adjustment should be Halo tendency. Focusing point is shown below.	 <p>The top end of Cross-Hatch</p>  <p>The center of horizontal line</p>  <p>The second vertical line from the left end.</p>  <p>Focus 2 Focus 1</p> <p>FBT SCREEN</p>

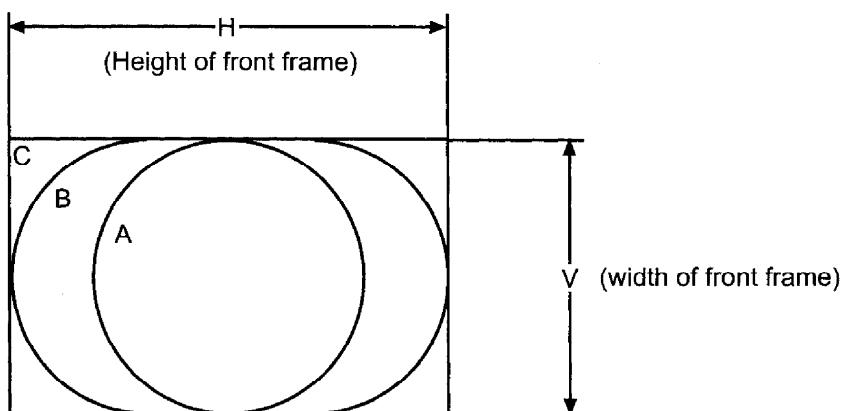

3.4 White balance adjustment (1)		Adj. point	
Preparation for adjustment		Adjustment procedure	
(1) 20 minutes heat-run is necessary before adjustment.	(1)	Turn screen adjustment VR clockwise gradually until horizontal line appears slightly on the surface of CPT. No longer change the data of color, data A, which appears the first.	Adjustment criteria : more than 0.5V with cathode voltage conversion
(2) The surface of CPT should be less than 20 lux.	(2)	Adjust white balance so that equally RGB lines appear slightly in low light	Adjustment criteria : less than 0.5V with cathode voltage conversion
(3) Check if the value of sub-black level center is 64 at adjustment No.P10.	(3)	Release stopping vertical deflection.	Adjustment No. P05 R cut OFF P06 G cut OFF P07 B cut OFF
(4) Receive white raster. TV Mode	(4)	Set contrast minimum, then set sub-brightness so that white raster appears slightly.	QC should guide suitably the people who is in charge of this adjustment so that white balance tolerance is minimum after heat-run.
(5) Turn screen VR, which is near FBT, full counterclockwise.	(5)	Set white balance meter at the center of the picture.	Low light(10~15cd/m ²)
(6) Send IIC data so as to stop vertical deflection.	(6)	Adjust white balance after calibrating brightness so that the level of white balance meter is 80% of full scale.	Adjustment No. P01 R Drive P02 B Drive
	(7)	Check if white balance is correct in low light with changing brightness by eyes. Adjust white balance at low light except for data A if white balance is incorrect, then return to adjustment process 7. White balance :9300° K	Do not use mirrors during Adjustment No. P05 R cut OFF P06 G cut OFF P07 B cut OFF
3.4 White balance adjustment (2)		Adj. point	
Preparation for adjustment		Adjustment procedure	
(1) Receive 100% white signal of VGA3.	(1)	Copy data at P01 to P17, then add 4 to P17. Copy data at P02 to P18.	
(2) Set brightness to the center, and contrast to the Maximum.	(2)	Confirm color temperature. Adjust color temperature by adjustment code P17 and P18, if it does not satisfy specification of 9300K; X=0.285, Y=0.294.	
(3) Set color temperature to 9300K mode.			

	3.5 Sub Brightness Adjustment																																																																			
	3.5.1 PC Mode																																																																			
Preparation for adjustment		Adjustment procedure				Notes																																																														
(1)	(1) Do this adjustment after deflection system adjustments are finished.				(1) Set white balance meter at the center of the screen.																																																															
(2)	(2) Receive all black signal.				(2) Set sub brightness adjustment to 0.3ft-L (1.0cd/m ²).																																																															
(3)	(3) Select VGA3 of Group 1. color temperature : 9300K																																																																			
(4)	(4) Set contrast to the minimum.																																																																			
(5)	(5) Set brightness to the maximum.																																																																			
	3.5.1 PC Mode																																																																			
(1)	(1) Start adjustment 20 minutes or more after the power is turned on. Receive the color bar signal. Select SUB BRIGHT adjust STAGE BY R / C JIG. Adjustment code of Factory : P10.	(1) Adjust so that the points A1 and A2 sink to black and A3 slightly above it rises by pressing $\blacktriangleleft\blacktriangleright$ key of R/C JIG. to store data.	(2)	<table border="1"> <tr> <td>W 75%</td> <td>Y</td> <td>CY</td> <td>G</td> <td>MG</td> <td>R</td> <td>BL</td> </tr> <tr> <td>A7</td> <td>A6</td> <td>A5</td> <td>A4</td> <td>A3</td> <td>A2</td> <td>A1</td> </tr> <tr> <td colspan="7"><hr/></td> </tr> <tr> <td colspan="7">B</td> </tr> <tr> <td colspan="7"><hr/></td> </tr> <tr> <td colspan="7">C</td> </tr> <tr> <td colspan="7"><hr/></td> </tr> <tr> <td colspan="7">D</td> </tr> <tr> <td>Q</td> <td>I</td> <td>W 100%</td> <td colspan="4">BLK</td> </tr> </table>	W 75%	Y	CY	G	MG	R	BL	A7	A6	A5	A4	A3	A2	A1	<hr/>							B							<hr/>							C							<hr/>							D							Q	I	W 100%	BLK				Remarks * check it without using a mirror.

			<p>Adjustment specification : Within ± 0.3 step</p> <p>Quality control specification: Within ± 0.5 step</p>																																																																	
			<p>Note:</p> <p>When selecting SUB-BRIGHTNESS mode, micro sets CONTRAST and COLOR to the minimum automatically, then other control to the Center.</p>																																																																	

	3.6 Convergence Check			
Preparation for adjustment		Adjustment procedure		
(1) Input LINEARITY TEST PATTERN (9 x 11 lines) signal.	(1)	Measure mis-convergence value between red and green, blue and green and red and blue.		
	(2)	Touch up with ferrite sheet in case red vertical and horizontal lines, especially in Zone C, are remarkably visible, even if set meet the following specifications.		

Criteria

Area	A	B	C
Mis-convergence specification	Within 1.0mm (0.0394 inches)	Within 1.5mm (0.0591 inches)	Within 2.5mm (0.0787 inches)

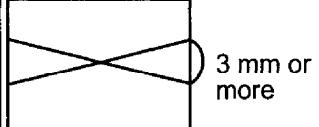

Area A, B and C on the screen

Area A: Inside circle with radius of $1/2 V$ (height of front frame)

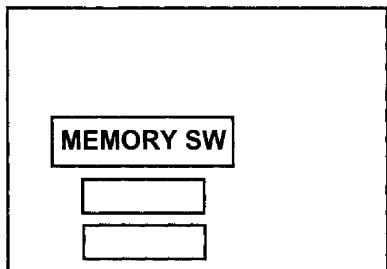

Area B: Inside circle with radius of $1/2 H$ (width of front frame), outside Area A

Area C: Outside Area B

3.7 VM Check			
Preparation for adjustment		Adjustment procedure	
(1)	Receive Circle Pattern signal, then select TV or PC mode.	(1)	Short-circuit between pins 3 and 4 of PCT connector on VM PWB, then check that width of vertical line of the circle pattern changes.
3.8 Rotation Check			
(1)	Receive Cross-Hatch or Circle Pattern signal	(1)	Perform rotation in + and - directions, then check if pattern moves 3 mm or more. 

4. Settings for shipping

- (1) Memory Initialize.
- (2) Check that OSD appears.

- (3) Press Recall of remote handset.
- (4) The settings when shipping are as follows

No.	Name	Specification	36SDX88B
1	Reception Channel	03 Channel	x

6.4 Main PWB

Circuit Descriptions

1. Tuner (F-EVP-50SR)

This chassis uses a 181 channel tuner in which the / PLL section (prescaler built-in) and IF section are made into one unit.

MTX matrix (TA1270 DAC 1/2)		
Mode	DAC1	DAC2
Stereo	Low	High
Mono	Low	Low
SAP	High	High

2. Power Supply

The MM1 chassis consists of the standby power supply (which is activated when the power cord is plugged in, to control the microprocessor) and the main switching supply (which operates the deflection and signal functions). I901 is a hybrid IC, with a built-in MOSFET.

2.1 Features

- Small SIP full mold package.
- Small number of external components.
- Soft switching and quasi resonant operation.
- Designed for a light load mode.
- Guaranteed avalanche energy.
- Many protection functions.
- Soft start function.

2.2 Standby Operation

When the power cord is plugged in, T951 (pin 16 and 17) will provide regulated +7V standby, and from this a regulated +5V is supplied to I001 from I956. I001 is now in standby mode until the front panel power button is pressed, or the remote control power code is received. At power on, pins 14 to 16 of I001 will go high, switching Q912 which causes current to flow through Q931, which starts the switching circuit.

2.3 Switching Operation

When the D901 rectified voltage appears at pin 5 of I901 starts oscillating at 22.5V and continues until the voltage drops below 15.1V. After start up, the voltage at the return winding of T901 is rectified by D980 and pin 5 is supplied with a stable voltage proportional +B. The oscillator C981 is connected to the Drain of the MOSFET (pin 1, I901) and smoothes the rising edge of the pulse. This creates a pseudo resonance function in order to delay activation of the MOSFET, to reduce loss and noise interference.

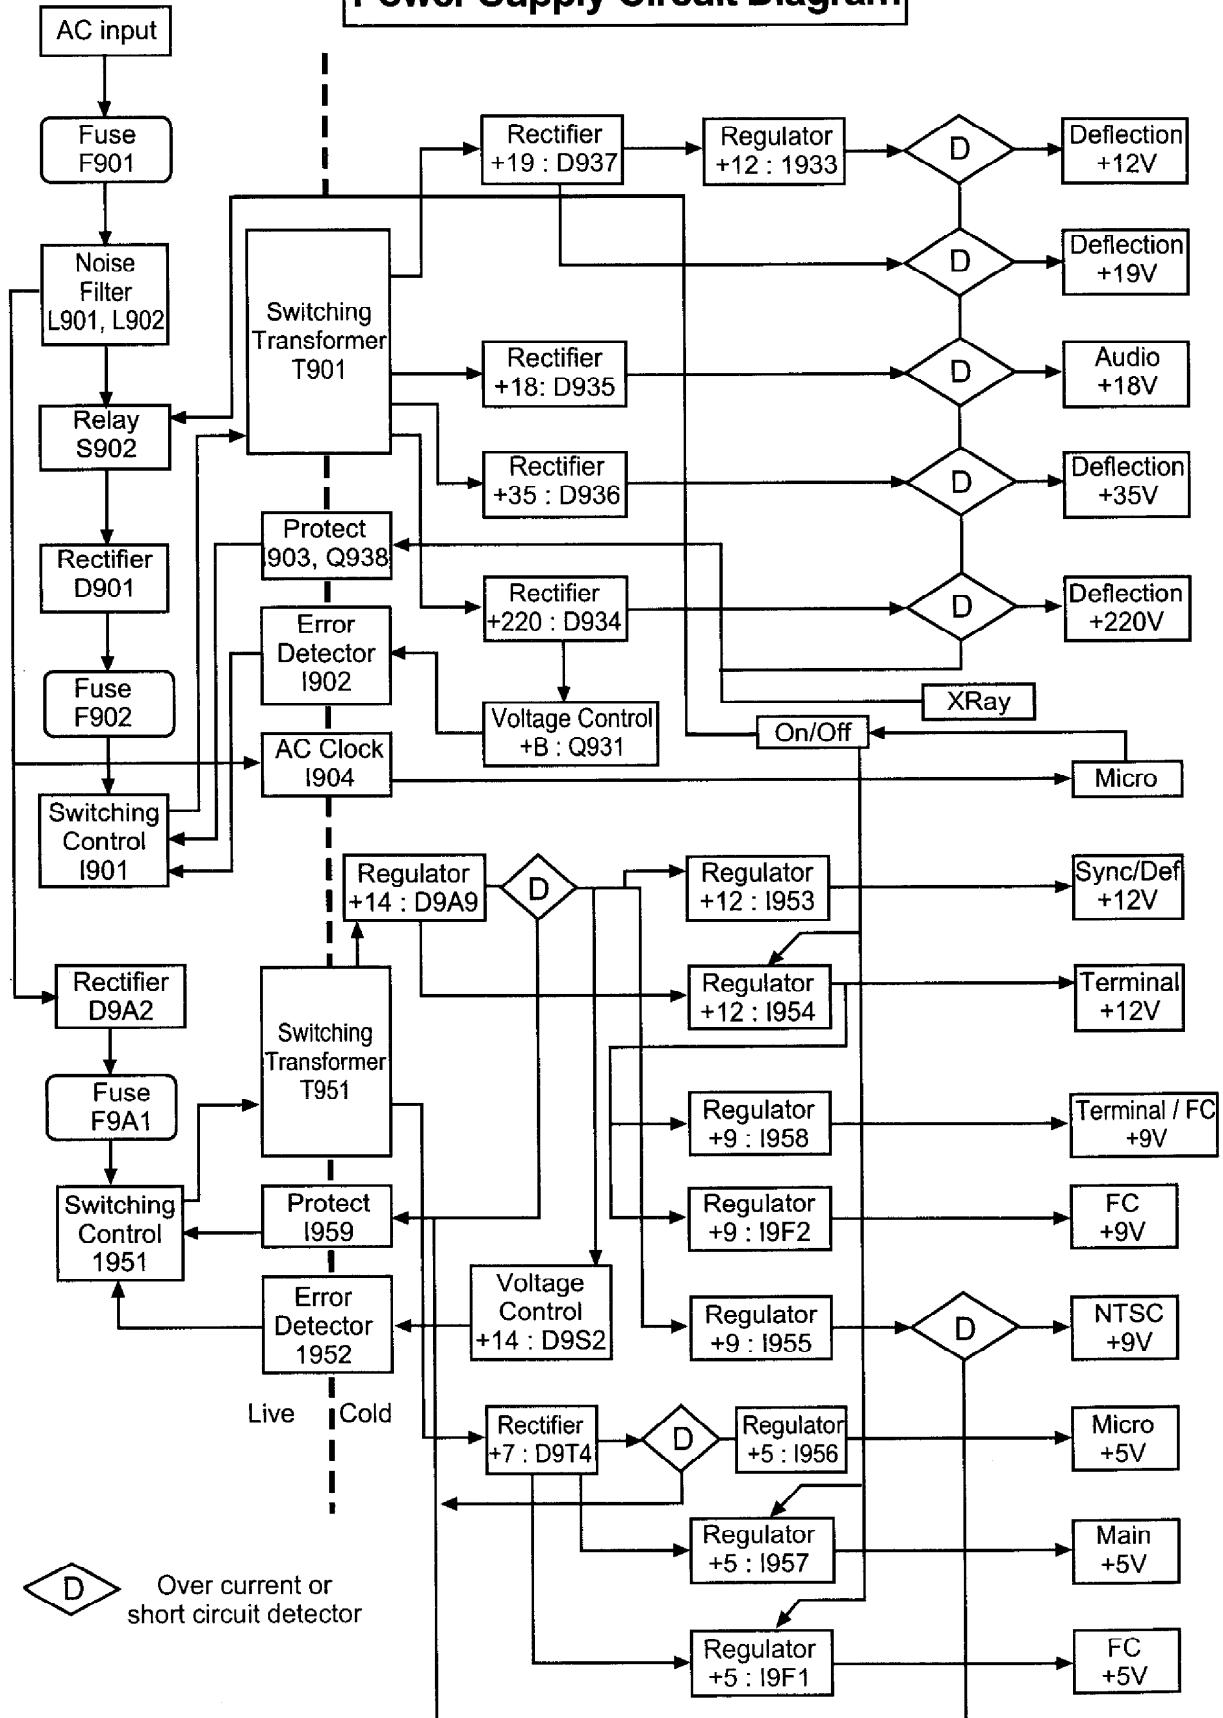

2.4 Voltage Regulation

During normal operation, the +B voltage is checked for stability at Pin 1 of Q931, and changes in voltages are sent to I902, and back to feedback pin 6 of I901 in order to change the pulse duration and stabilize the +B voltage.

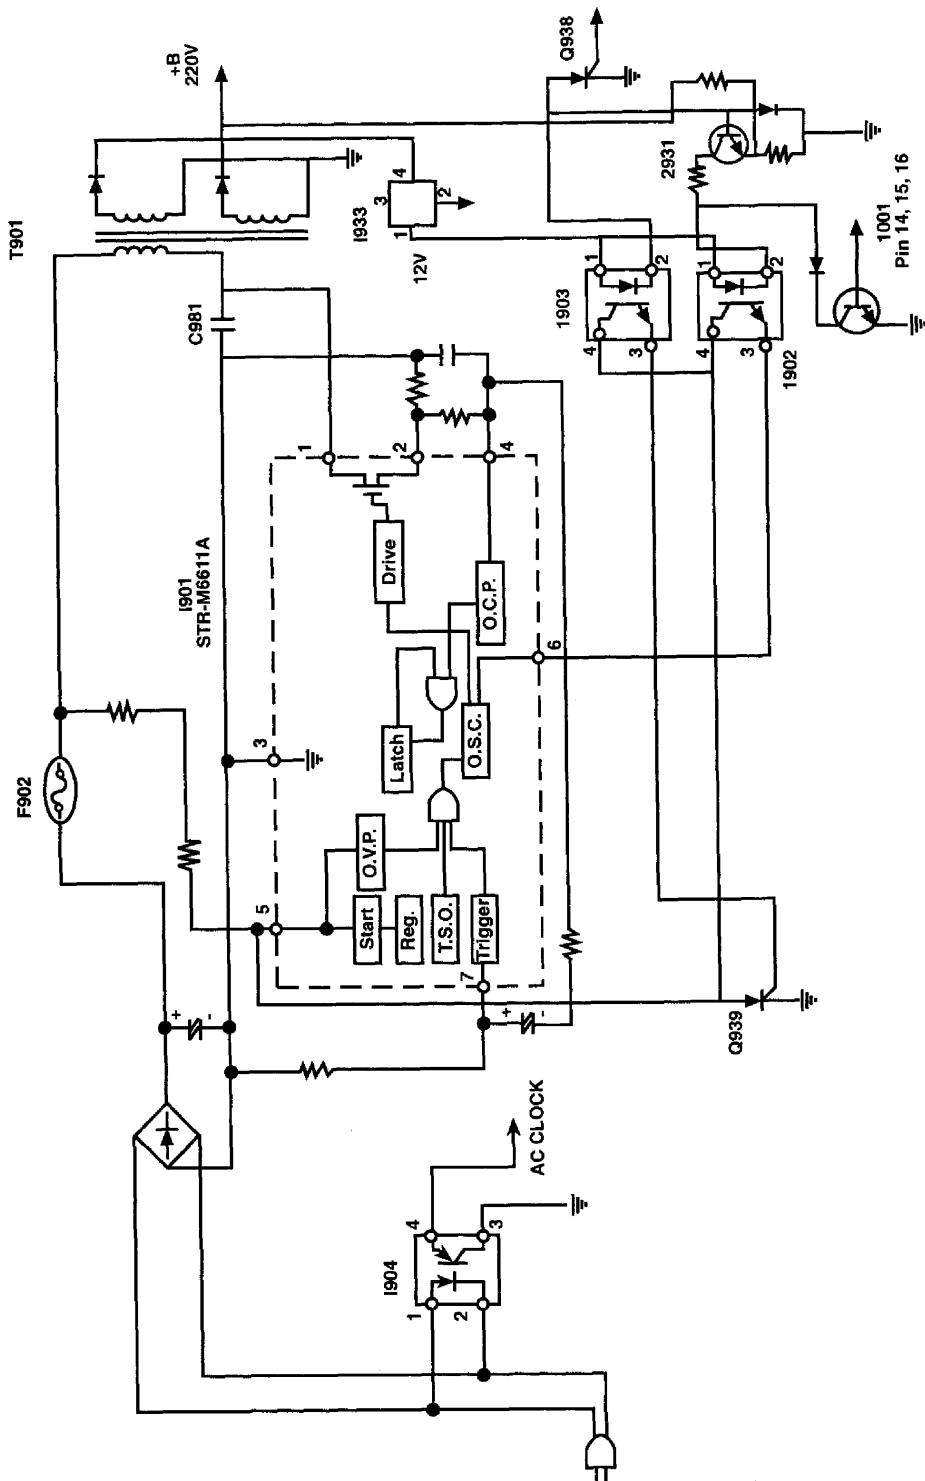

2.5 I901 Protection

- 1) Current Limiter : pin 4 of I901 senses an over current condition at 0.5V. The switching operation continues but the MOSFET will turn off each pulse when pin 4 is detecting an over-current condition. This pin is also used for pseudo resonance mode action.
- 2) Over-Voltage Protection : If the input voltage is too high (pin 5 voltage higher than about 30.8v), and oscillation will stop.
- 3) Thermal Protection : Oscillation will stop if I901 case temperature is above 150 degrees Celsius.
- 4) Soft Start : At initial start-up, the 4 volts present at pin 7 is input as a differential voltage to pin 4 by means of C987. This modifies the pulse during start-up and allows a current limited soft start condition.
- 5) Secondary Circuit Protection : Protection action of secondary-circuit is made up of Q938 entirely. If Q938 turns on, it makes Q939 turn on, then make pin 5 of I901 low to stop oscillation.

Power Supply Circuit Diagram

Power Supply Circuit

3. Microprocessor I001 Pin Description

3.1 I001 Pin Functions

Pin No.	Name	Function
1	RMIN	This is the input for remote control signals from the receiver "UG01".
2	SDA3	This is the data for IIC communication. I ² C for I002, I003 and Audio
3	SCL3	This is the clock for IIC communication.
4	A/D IN	Input for front control keys.
5	AFC	AFC AD input from U101 pin 16.
6	K04	Matrix-out for Auto Link.
7	+B Select	This is the output for +B selection.
8	SDA (Mouse)	This is the data for Mouse control IC IM01
9	USB IRQ	Unused
10	Request (Mouse)	Interrupt request rail from Mouse control IC IM01
11	Picture Blanking	This pin mutes the video when changing channels or selecting A/V inputs or PC Mode.
12	SCL (Mouse)	This is the clock for Mouse control IC IM01
13	IIC Enable	This is the pin for stopping micro jobs. Low : Stop, High: Work
14	Power 1	When power is turned on, this pin goes "H" to switch Q912 and S902 to turn main power on.
15	Power 2	When power is turned on, this pin goes "H" to switch Q913 and S903 to short rush resistor.
16	Power 3	When power is turned on, this pin goes "H" to switch Q912 and S902 to turn main power on.
17	H Select 1	Unused
18	H Select 2	This pin switches mode in PC mode. VGA : Low, DTV / SVGA : High
19	H Select 3	This pin switches mode in PC mode. VGA / DTV : Low, SVGA : High
20	K01/SCL (FC)	Matrix output for power switch. This is the clock for IIC communication of Flex Controller.
21	K02/SDA (FC)	Matrix output for Auto Link detect and Stereo broadcast detection. This is the data for IIC communication of Flex Controller.
22	Vdd	Vdd +5V Input
23	CREFO	CREFO is connected to GND. Data slice output level for CCD.
24	VPH0	VPH0 is the input for the composite video for CCD.
25	P27, VCP	Unused
26	CVBS0	CVBS0 is the input for the composite video for CCD.
27	K03	Matrix output for Second Audio Program and YUV detection.
28	TV / PC1	This pin switches between TV and PC. In TV mode it is High. In PC mode it is Low.
29	AC	This is the input for Clock / Timer counter. 50/60Hz det.
30	LED 2	This is the switch for red LED. On (DPMS in PC mode) : Low, Off (Others) : High
31	KI1	Matrix input for Power, Auto Link, and YUV Detection.
32	KI2	Matrix input for Stereo broadcast.
33	KI3	Matrix input for Second Audio Program.
34	SD	Sync input for TV mode.
35	LED 1	This is the switch for green LED. On : Low, Off : High
36	OSDX0	These pins are connected to an external LC circuit to provide a clock for OSD.
37	OSDX1	
38	Vss	GND
39	H Sync	This is the input for the H. Sync. signal for OSD.
40	Mute	This is the output signal used to mute the audio when changing channels. When the Mute button is pressed, this pin is set to "H".
41	OSD Blanking	This pin switches OSD and picture. Picture : Low, OSD : High
42	OSD R	
43	OSD G	This the OSD output for both TV-OSD and PC-OSD. OSD is sent to I501.
44	OSD B	
45	COMP	This is the pin for DAC phase compensation.
46	IREF	This is the pin to connect resistor for DAC bias setting. R040 connection for DAC bias current setting.
47	VREF	This is the input for DAC reference voltage.
48	OSD Shade	In case of selecting Shaded on Menu, this pin is "H" when OSD appears. It switches to reduce the level of the background video. Halftone to I501 pin 47 to reduce video level when OSD is ON.
49	AVdd	Vdd +5V Input (Analog)
50	PDO	This pin is the output for Internal phase comparison. Internal PLL input.
51	VCO1	This pin is the input for internal VCO.
52	TEST	TEST is connected to Vdd.
53	SDA 1	This is the data for IIC communication.
54	Reset	When the power is turned on, a reset is initiated to perform RAM check and read last data input to the EEPROM. The reset pin is held "L" (1.5 or less) for approx.
55	V Sync	This is the input for the V. Sync. signal for OSD.
56	IRQ0	IRQ0 is connected to Vdd. External interrupt request line held high.
57	FC Enable	Interrupt request rail from Flex. controller unit UFC.

58	SCL1	This is the clock for I ² C communication.
59	SDA2	This is the data for I ² C communication.
60	SCL2	This is the clock for I ² C communication.
61	Vdd	Vdd +5V Input
62	OSC1	These pins are connected to an external oscillator circuit for internal clock circuit when power-on this OSC1 clock start oscillation. 4 MHz oscillator for MPC.
63	OSC2	
64	Vss	GND

MICROPROCESSOR (I001)

The microprocessor used is 16-bit CPU, 144KB ROM and 5 KB RAM. Oscillator frequency is 4 MHz with two I²C interfaces. There are 2 internal sync. separators for CCD decoding.

I²C BUS

The I²C bus controller interfaces via six internal control registers.

I²C transmission from master/slave receiver, slave transmitter/receiver allows direct I²C protocol. An interrupt is generated when transfer ends then clears to high at the next write to I²C. If the UPC is the slave transmitting and transfer ends, the clock line clears at a read of I²CREC after ACK=!

The Hardware monitors the I²C bus line so the Software can start a transfer at any time.

Through Software control the I²C bus controller can force the clock line to reset the circuit leaving the contents of the address and clock registers the same.

CLOSED CAPTION SYSTEM

The closed caption decodification is made by an algorithm of the Micon IC. The CCD data captioning algorithm utilizes sampling of the composite video signal during line 21. In order for the CCD algorithm to recognize CCD burst (seven clock cycles of 503khz) certain timing relationship between incoming composite video signal and horizontal flyback pulse (FBP) should be maintained. This algorithm determines the display position, screen display (Roll-Up, Pop-On, Paint-On), format and character attributes (color italics, underline, and flash).

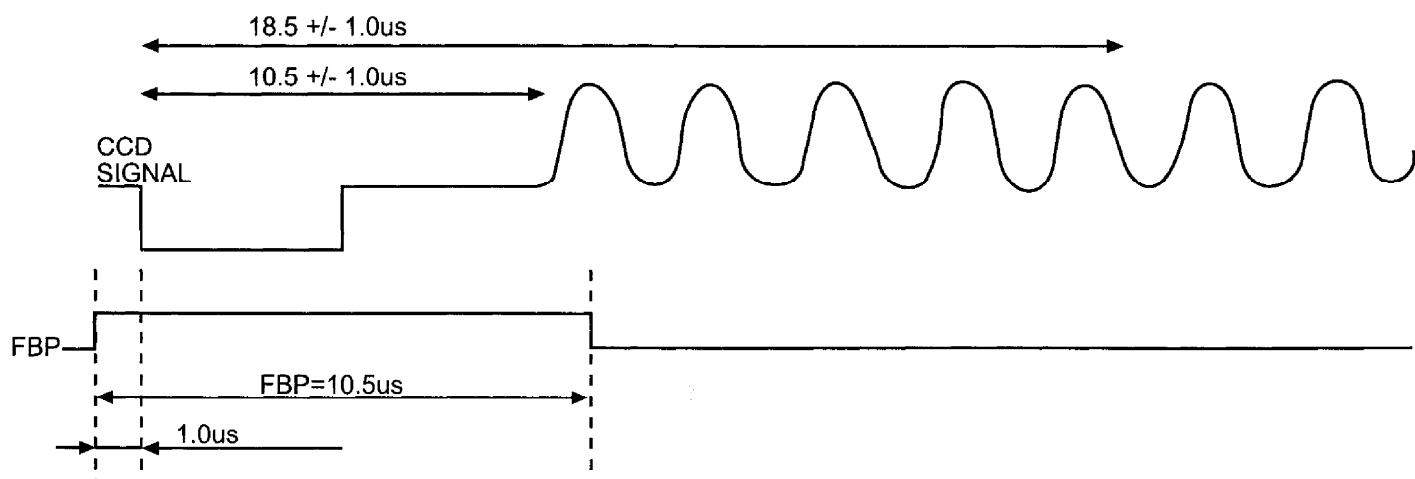

Fig. 3.2.1 Optimal Timing for CCD Data Capture Algorithm.

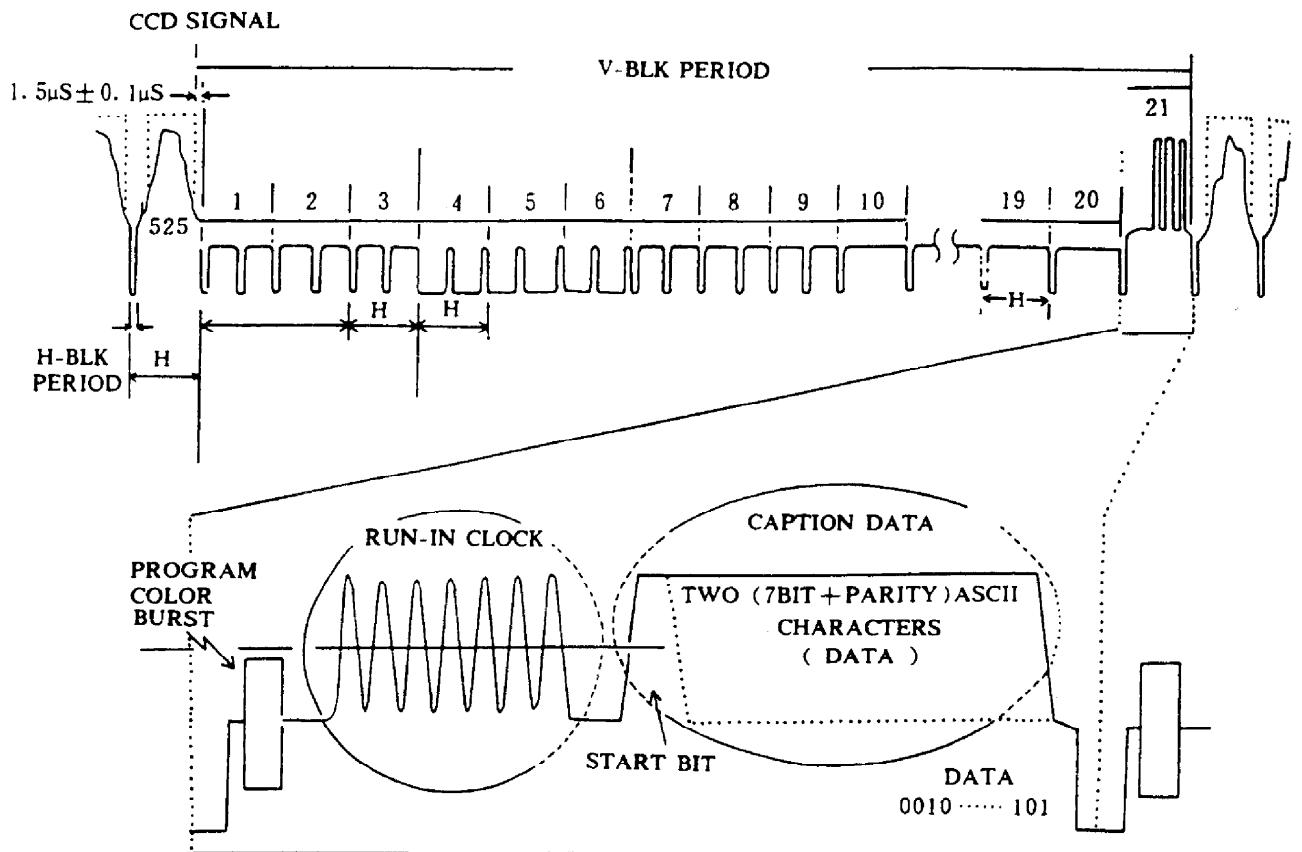

Fig. 3.2.2 CCD Signal

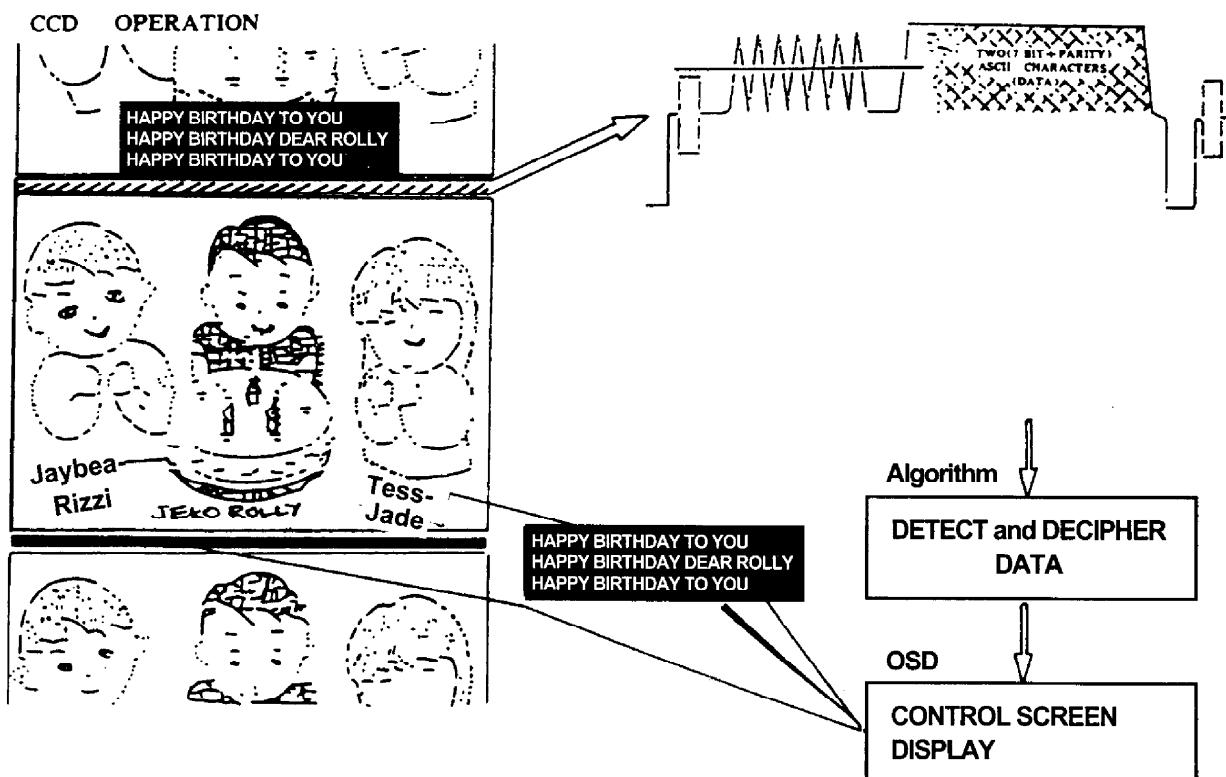

Fig. 3.2.3 CCD Operation

4. Memory

4.1 Memory

M24C16-BNG

The memory is an electrically erasable programmable memory (EEPROM) fabricated with High Endurance Single Polysilicon CMOS technology which guarantees an endurance typically well above one million erase/write cycles with a data retention of 40 years.

The memory is compatible with the I²C standard, two wire serial interface which uses a bi-directional data bus and serial clock. The memory carry a built-in 4 bit unique Device Type Identifier code (1010) which corresponds to the I²C bus definition. The Device Type Identifier code is used together with 3 Chip Enable bits. Depending on the size of the device memory, these Chip Enables bits can be directly linked to the E0-E1-E2 input pins or can be used as Most Significant Address bits for the memory area. The I²C protocol allows to address up to 16K bits of memory on the same bus. Using the E0-E1-E2 inputs pins.

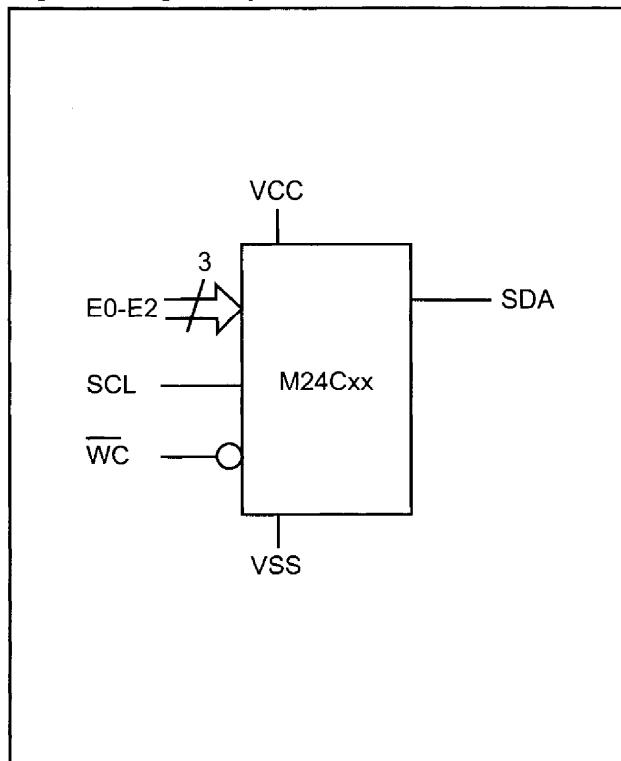

Table 1. Signal Names

E0-E2	Chip Enable Inputs
SDA	Serial Data Address Input/Output
SCL	Serial Clock
WC	Write Control
Vcc	Supply Voltage
Vss	Ground

The memory behaves as a slave device in the I²C protocol with all memory operations synchronized by the serial clock. Read and write operations are initiated by a START condition generated by the bus master. The START condition is followed by the Device Select Code which is composed by a stream of 7 bits (Device Type Identifier code '1010' followed by the 3 Chip Enable bits), plus one read/write bit (R W) and terminated by acknowledged bit.

When writing data to the memory, it responds to the 8 bits received by asserting an acknowledge bit during the 9th bit time. When data is read by the bus master, it acknowledges the receipt of the data bytes in the same way. Data transfers are terminated with a STOP condition after an Ack for WRITE and after a No Ack for READ.

Figure 1. Logic Diagram

Power On Reset: V_{cc} lock out write protect. In order to prevent any possible data corruption and inadvertent write operations during power up, a Power On Reset (POR) circuit is implemented. Until the V_{cc} voltage has reached the POR threshold value, the internal reset is active, all operations are disabled and the device will not respond to any command. In the same way, when V_{cc} drops down from the operating voltage to below the POR threshold value, all operations are disabled and the device will not respond to any command. A stable V_{cc} must be applied before applying any logic signal.

SIGNAL DESCRIPTIONS

Serial Clock (SCL). The SCL input pin is used to synchronize all data in and out of memory. A resistor can be connected from the SCL line to V_{cc} to act as a pull up.

Serial Data (SDA). The SDA pin is bi-directional and is used to transfer data in or out of the memory. It is an open drain output that may be wire-OR'ed with other open drain or open collector signals on the bus. A resistor must be connected from the SDA bus line to V_{CC} to act as pull up (Figure 1).

Chip Enable (E0-E2). For the M24C16, there is no chip enable input. Only one M24C16 can be addressing on the same I²C bus. The E0, E1 and E2 pins are Not Connected.

These E0, E1 and E2 inputs may be driven dynamically or tied to V_{CC} or V_{SS} to establish the Device Select code.

Write Control (WC). A hardware Write Control pin (WC) is provided on pin 7 of the memory. This feature is useful to protect the entire contents of the memory from any erroneous erase/write cycle. The Write Control signal is used to enable ($WC=V_{IL}$) or disable ($WC=V_{IH}$) write instruction to the entire memory area. When unconnected, the WC input is internally read as V_{IL} and write operations are allowed. When WC=1, Device Select and Address bytes are acknowledged, Data bytes are not acknowledged.

4.2 Memory 24LC21A/P

1. DESCRIPTION

The Microchip Technology Inc. 24LC21A is a 128 x 8-bit dual-mode Electrically Erasable PROM. This device is designed for use in applications requiring storage and serial transmission of configuration and control information. Two modes of operation have been implemented: Transmit-Only Mode and Bi-directional Mode. Upon power-up, the device will be in the Transmit-Only Mode, sending a serial bit stream of the memory array form 00h to 7Fh, clocked by the VCLK pin. A valid high to low transition on the SCL pin will cause the device to enter the transition mode, and look for a valid control byte on the I²C bus. If it detects a valid control byte from the master, it will switch into Bi-directional Mode, with byte selectable read/write capability of the memory array using SCL. If no control byte is received, the device will revert to the Transmit-Only Mode after it receives 128 consecutive VCLK pulses while the SCL pin is idle. The 24LC21A is available in a standard 8-pin PDIP and SOIC package in both commercial and industrial temperature ranges.

BLOCK DIAGRAM

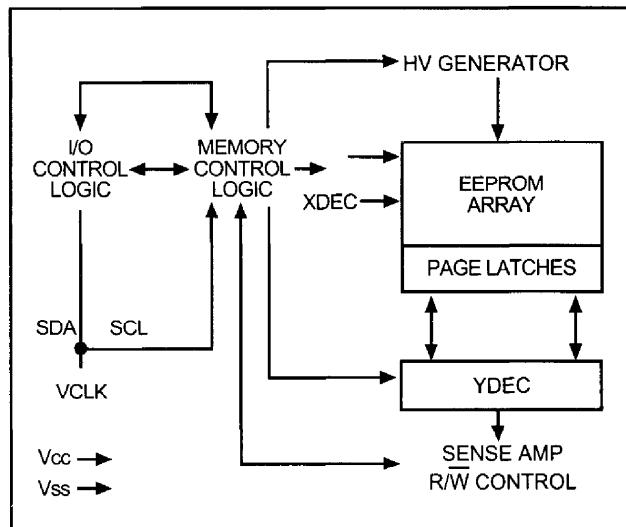

TABLE 1-1: PIN FUNCTION TABLE

Name	Function
Vss	Ground
SDA	Serial Address/Data I/O
SCL	Serial Clock (Bi-directional Mode)
VCLK	Serial Clock (Transmit-Only Mode)
Vcc	+2.5V to 5.5V Power Supply
NC	No Connection

PIN DESCRIPTIONS

1. SDA

This pin is used to transfer addresses and data into and out of the device, when the device is in the Bi-directional Mode. In the Transmit-Only Mode, which only allows data to be read from the device, data is also transferred on the SDA pin. This pin is an open drain terminal, therefore the SDA bus requires a pullup resistor to V_{CC} (typical 10 kΩ for 100 kHz, 1 kΩ for 400 kHz).

For normal data transfer in the Bi-directional Mode, SDA is allowed to change only during SCL low. Changes during SCL high are reserved for indicating the START and STOP conditions.

2. SCL

This pin is the clock input for the Bi-directional Mode, and is used to synchronize data transfer to and from the device. It is also used as the signaling input to switch the device from the Transmit-Only Mode to the Bi-directional Mode. It must remain high for the chip to continue operation in the Transmit-Only Mode.

3. VCLK

This pin is the clock input for the Transmit-Only Mode (DDC1). In the Transmit-Only Mode, each bit is clocked out on the rising edge of this signal. In the Bi-directional Mode, a high logic level is required on this pin to enable write capability.

2.0 FUNCTIONAL DESCRIPTION

The 24LC21A is designed to comply to the DDC Standard proposed by VESA (Figure 4-2) with the exception that it is not access bus capable. It operates in two modes, the Transmit-Only Mode and the Bi-directional Mode. There is a separate 2-wire protocol to support each mode, each having a separate clock input but sharing a common data line (SDA). The device enters the Transmit-Only Mode upon power-up. In this mode, the device transmits data bits on the SDA pin in response to a clock signal on the VCLK pin. The device will remain in this mode until a valid high to low transition is placed on the SCL input. When a valid transition on SCL is recognized, the device will switch into the Bi-directional Mode and look for its control byte to be sent by the master. If it detects its control byte, it will stay in the Bi-directional Mode. Otherwise, it will revert to the Transmit-Only Mode after it sees 128 VCLK pulses.

2.1 Transmit-Only Mode

The device will power up in the Transmit-Only Mode at address 00H. This mode supports a undirectional 2-wire protocol for continuous transmission of the contents of the memory array. This device requires that it be initialized prior to valid data being sent in the Transmit-Only Mode (Section 2.2). In this mode, data is transmitted on the SDA pin in 8-bit bytes, with each byte followed by a ninth, null bit. The clock source for the Transmit-Only Mode is provided on the VCLK pin, and a data bit is output on the rising edge on this pin. The eight bits in each byte are transmitted most significant bit first. Each byte within the memory array will be output in sequence. After address 7Fh in the memory array is transmitted, the internal address pointers will wrap around to the first memory location (00h) and continue. The Bi-Directional Mode Clock (SCL) pin must be held high for the device to remain in the Transmit-Only Mode.

2.2 Initialization Procedure

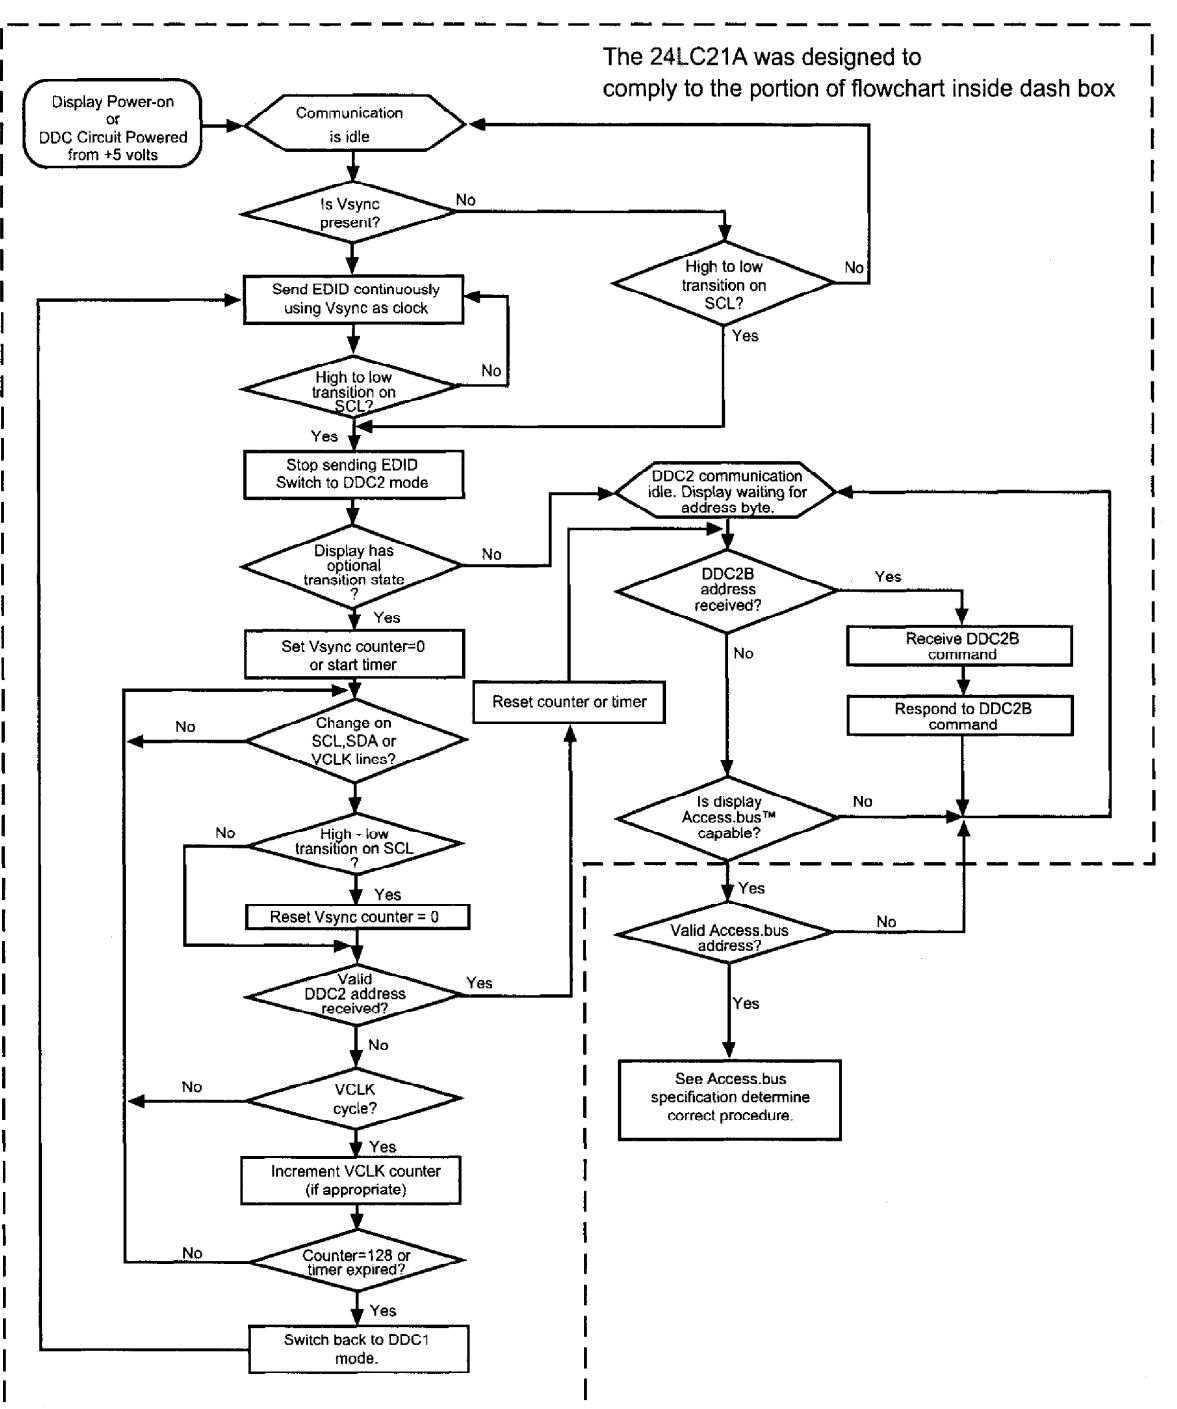

After Vcc has stabilized, the device will be in the Transmit-Only Mode. Nine clock cycles on the VCLK pin must be given to the device for it to perform internal synchronization. During this period, the SDA pin will be in a high impedance state. On the rising edge of the tenth clock cycle, the device will output the first valid data bit which will be the most significant bit in address 00h.

3.0 BI-DIRECTIONAL MODE

Before the 24LC21A can be switched into the Bi-directional Mode it must enter the transition mode, which is done by applying a valid high to low transition on the Bi-directional Mode Clock (SCL). As soon it enters the transition mode, it looks for a control byte 1010 000X on the I²C™ bus, and starts to count pulses on VCLK. Any high to low transition on the SCL line will reset the count. If it sees a pulse count of 128 on VCLK while the SCL line is idle, it will revert back to the transmit-Only Mode, and transmit its contents starting with the most significant bit in address 00h. However, if it detects the control byte on the I²C™ bus, it will switch in the Bi-directional Mode. Once the device has made the transition to the Bi-directional mode, the only way to switch the device back to the Transmit-Only Mode is to remove power from the device.

Once the device has switched into the Bi-directional Mode, the VCLK input is disregarded, with the exception that a logic high level is required to enable write capability. This mode supports a two-wire Bi-directional data transmission protocol (I²C™). In this protocol, a device that sends data on the bus is defined to be the transmitter, and a device that receives data from the bus is defined to be the receiver. The bus must be controlled by a master device that generates the Bi-directional Mode Clock (SCL), controls access to the bus and generates the START and STOP conditions, while the 24LC21A acts as the slave. Both master and slave can operate as transmitter or receiver, but the master device determines which mode is activated. In the Bi-directional mode, the 24LC21A only responds to commands for device 1010 000X.

FIGURE 4.2 DISPLAY OPERATION PER DDC STANDARD PROPOSED BY VESA

5. PC-MOUSE Microcomputer IM01 (M37470M4) (see Fig. 5.1 and 5.2)

In PC mode, PC-PS2 mouse can be controlled by the R/C handset through a connection to the PC via the 6pin mini din jack provided at the rear of the unit. The microcomputer for mouse control is IM01 (M37470M4, an 8-bit controller). I001 the main u-con is the master and IM01 is the slave. Communication between the PC, I001, and IM01 is through Bi-directional Serial Bus of TTL level.

Communication request from the PC is through the PS-2 CLK. and DATA lines. IM01 REQ. output (pin #1) is sent to I001 (pin #4). I001 sends CLK and DATA signals from pins 8 and 12 to IM01 pins 2 and 4.

QM01 and QM02 are switches send clk and data signals to PC via the I/O pins of the jack (JM03). IM01 pin#18 is the reset IM02 is the reset IC which holds pin #18 "L" for 2uS or more until the VCC rises to approx. 5V.

7. Sync. Signal Processing I

Operation Procedure

- 1) IS01 detect input signal, then calculate H/V signal frequency and polarity. IS01 controls H out, Blank out, Vertical Saw out, and East / West out, according to the H/V sync. input signal.
- 2) I001 read H/V signal frequency and polarity via IS01 by IIC bus.
- 3) I001 change mode, then send UPC1885 appropriate data for H/V size and pincushion, according to the input signal timing.

Vertical and Horizontal Drive Signal Flow

Description

- V Drive The vertical sync signal from TV /PC sync circuit is input to IS01 pin #28 on Sync PWB. IS01 make vertical saw tooth and it is output at IS01 pin #8 to I601 pin #6.
- H Drive The FBP (Fly Back Pulse) is applied to IS01 pin #17. East/West out is output at IS01 pin #9 to operation amplifier IS02. It is amplified by IS02, then output it at IS01 pin #1 to IP01 pin #14. Side pin drive pulse, which is modulated with vertical East / West, is output at IP01 pin #7 and controls +B voltage. H out is output at IS01 pin #18 to Q701 base.
- V Position The vertical position circuit composed of I005, Q603, Q604, and Q605. The vertical position output from I005 pin #17 varies the base of Q503, which changes the DC bias being added to the V DY by Q604 and Q605 through R611, R612, R613, and R614 to change the vertical position of the picture.

VERTICAL DEFLECTION CIRCUIT(LA7846)

A vertical sawtooth voltage is input at pin (6). At the start of the retrace period a pulse voltage occurs at pin (3). This voltage is added to the voltage across C606. The sum is approx. 50V which is necessary for during then retrace period. C606 then discharges and the cycle starts again.

9. Horizontal Output Operation

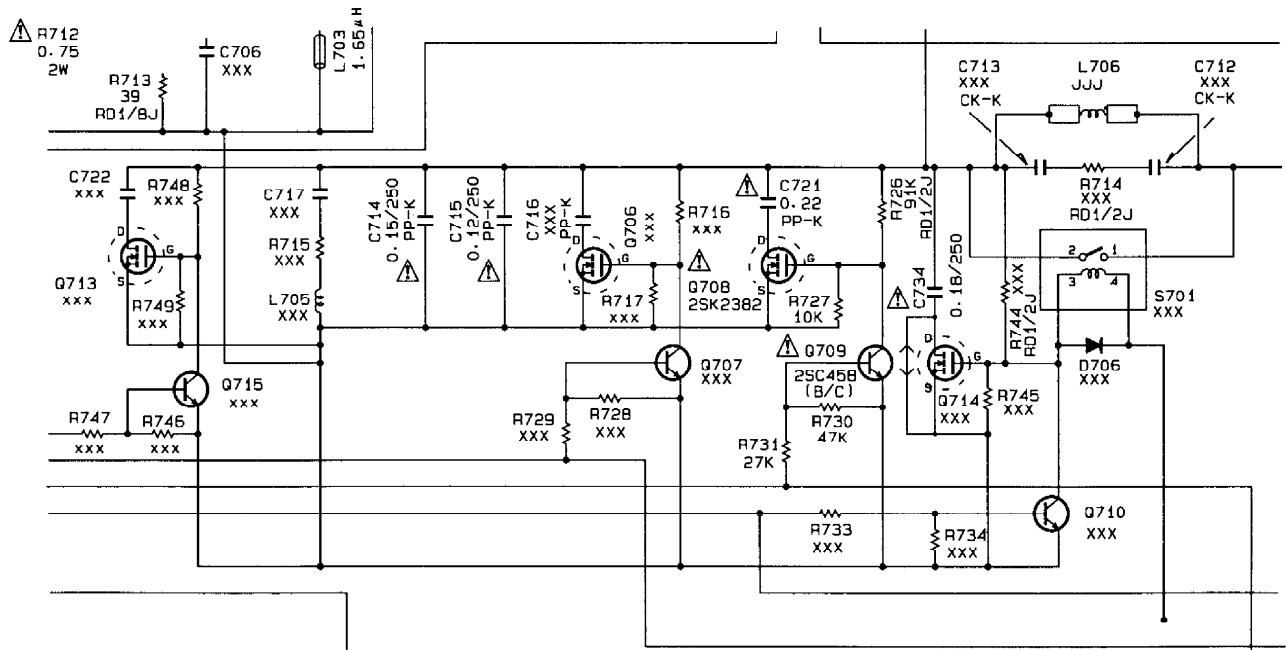

The Horizontal deflection circuit consists of Q701 (H.Driver), and Q702(H.output) to drive the H.DY. Q705 and damper diode D705 switches according to the pulse voltage from the H.drive circuit to supply the H.DY coil with a sawtooth current. C707, C708, C709, and C710 resonates with the H.DY coil. C718, C719, R718, and L707 corrects H.Linearity. The Horizontal output, Q705 and the damper D705 perform switching operation to supply the H.DY deflection current. When Q705 conducts, the current in the H.DY coil increases linear until Q705 is cut-off. The energy stored in the DY decreases, changing the resonance capacitors C707, C708, C709, and C710. These capacitors then discharges across the DY coil in a reverse direction. D705 conducts to suppress this reverse voltage. When the damper current becomes zero, C705 conducts again.

T702 secondary output voltages are rectified by D710 and D711 and provides DC bias for the H.DY through Q711 and Q712.

Figure below shows the components which are switched in TV/VGA mode and SVGA mode by switching Q708 and Q709.

In TV and VGA mode, Q709 is cut off, and Q708 is on. Q708 is made to conduct, adding C721 for "S" correction.

In SVGA mode, Q709 is on, and Q708 is off. Q708 is made to conduct, removing C721 for "S" correction.

10. HV Regulation / Raster Centering/HV Circuit/Dynamic Focus Circuit Operation

10.1 HV Regulation

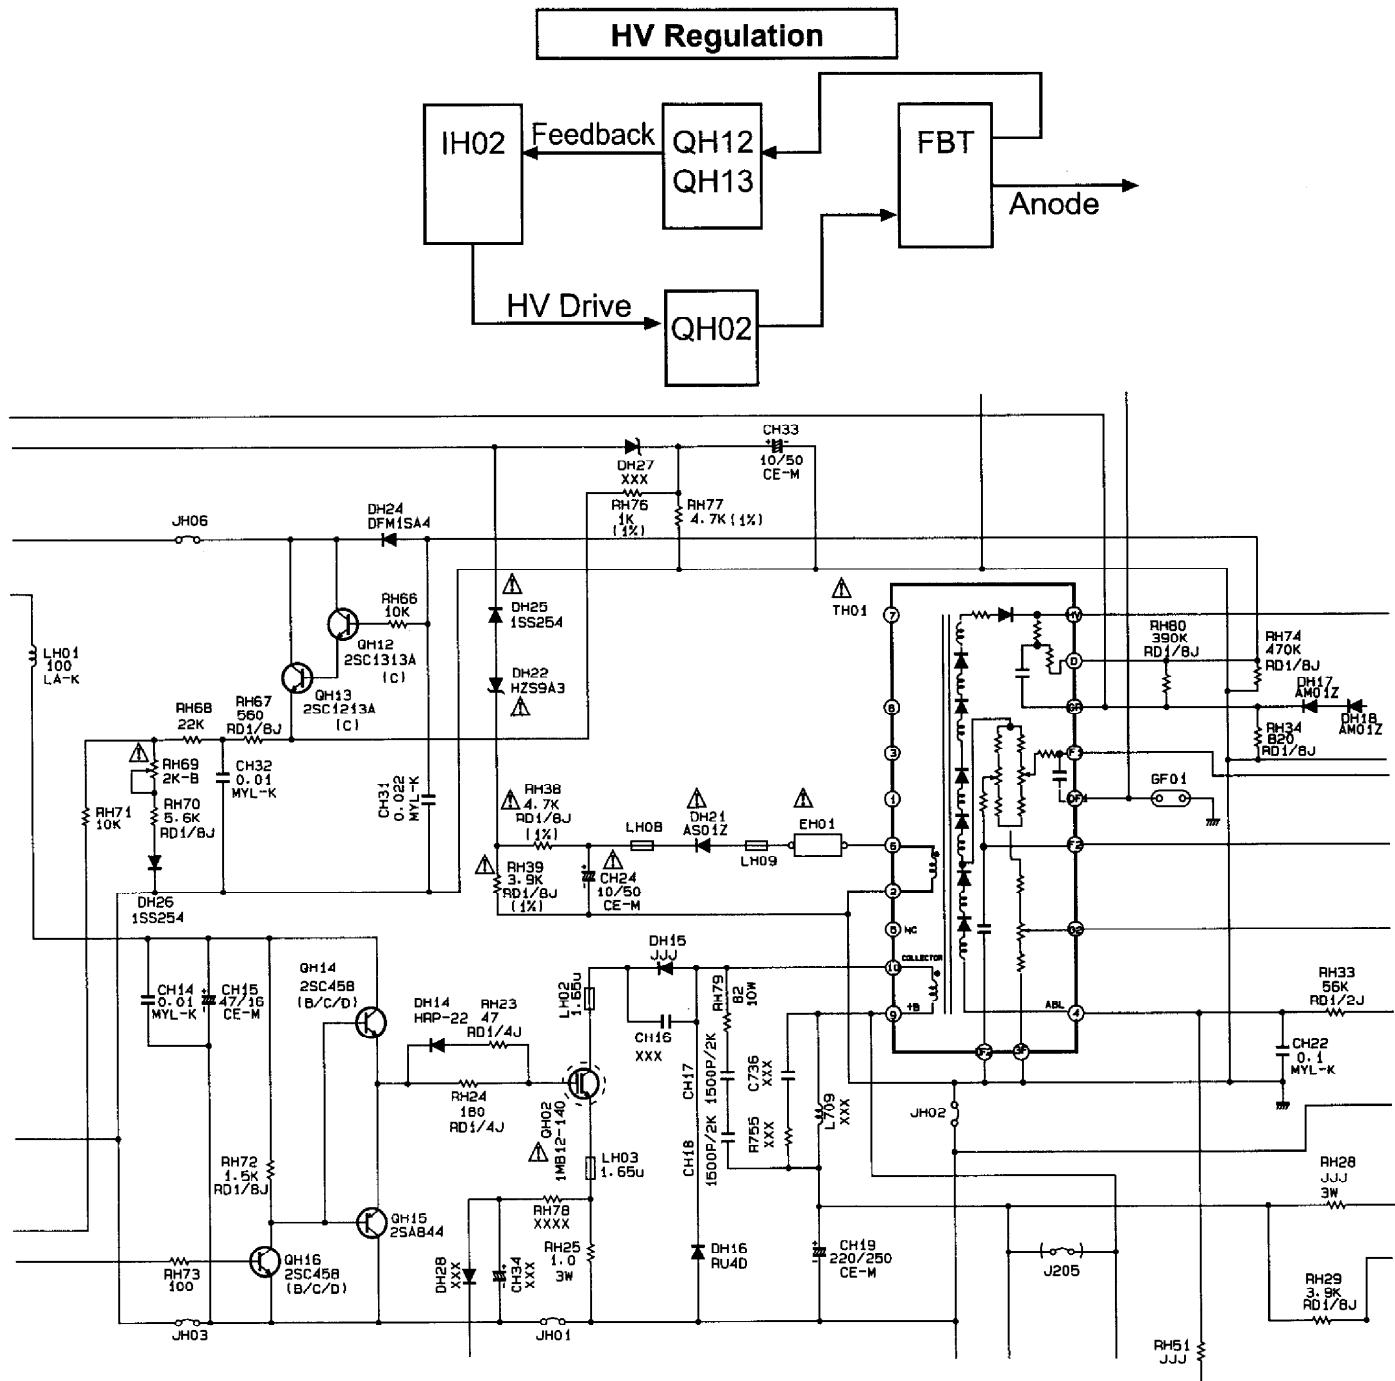

HV regulation is done by applying the divided voltage of TH01 high voltage to QH12, QH13 transfer the voltage change to IH02 pin #1 to regulate the HV depending on the brightness of the picture.

The HV stabilized by modulating the HV drive pulse width to control the ON/Off switching of QH02.

If the picture goes bright, the HV falls then QH12 turns on and the voltage at QH13 is applied to IH02 pin (1) connected to the internal error amplifier which compares it to a reference voltage at pin (14). The voltage at pin (12) drops and the internal comparator changes to change the width of the output pulse voltage. The ON time of QH02 becomes longer to stabilize the HV.

10.2 Raster Centering Circuit

R741 adjust raster position by changing Q711 (B) and Q712 (B) voltage. The output voltage flows through L708 to L707 (linearity circuit) in series with H. DY coil to shift the center by changing its bias.

10.3 HV Circuit

High Voltage circuit for CRT anode voltage and regulation consist of IH02 (Control IC), drivers QH14, QH15, QH16, and HV output QH02.

When the TV is switched on, IH02 internal oscillator starts up to generate a pulse voltage as a source for the HV drivers. IH02 also regulates the HV to keep the picture size fixed by controlling the HV pulse width when the picture brightness changes.

IH02 oscillator time constant is dependent on RH19 and CH10. H. blk pulses are applied to pin (10) as a trigger and to synchronize the oscillator.

A sawtooth voltage is generated and compared with to the voltage at pin (12) to produce a pulse voltage, which is output at pin (7) to the HV drivers. QH16, QH14, AND QH15 amplifiers this pulse voltage to drive QH02 which produces a HV pulse at QH02 © to the FBT TH01 to provide Anode, focus and screen voltages.

10.4 Dynamic Focus Circuit Operation

The dynamic focus circuit improves the focus at the corners of the screen. This requires higher focusing voltage due to the distance from the center. The focus voltage is varied in a parabolic form as the electron beam scans horizontally and vertically.

The FBT pulse is integrated by LF02 and CF05 then amplified by QF05 and clamped by QF04(DF PWB).The amplitude is increased by QF53, QF52 and QF55 provides temperature stability.

The vertical output pulse is integrated by RF19 and CF09 (DF PWB) to produce a parabolic wave form. It is amplified by QF58 and added to the Horiz. Parabola and applied to the Focus pin (DF) on FBT TH01.

11. VM Circuit Operation

The VM circuit improves the definition between black and white edges by accelerating or decelerating the horizontal scanning speed of the electron beams. As a result, the gradient of the ramp of the leading edge of the luminance signal is increased with the brightness changes and the video bandwidth of the video signal narrowed simultaneously to sharpen the edged.

The Y signal is differentiated by Q552. The second differential of the Y signal is applied to Q556, VM amplifier, then to the VM drivers, QL08 and QL09 are the VM output amplifiers which drive the VM coil the current applied to the VM coil creates a magnetic field which varies the velocity of the horizontal scanning of the electron beam. The Ys signal is applied to Q555 to cut-of the VM when OSD is displayed. Q552, Q555, and Q556 are sub VM circuit. QL08 and QL09 are VM circuit.

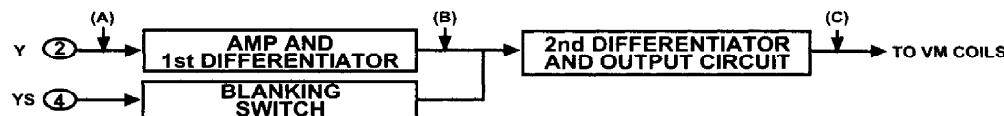

Fig. 11.1 VM Block Diagram

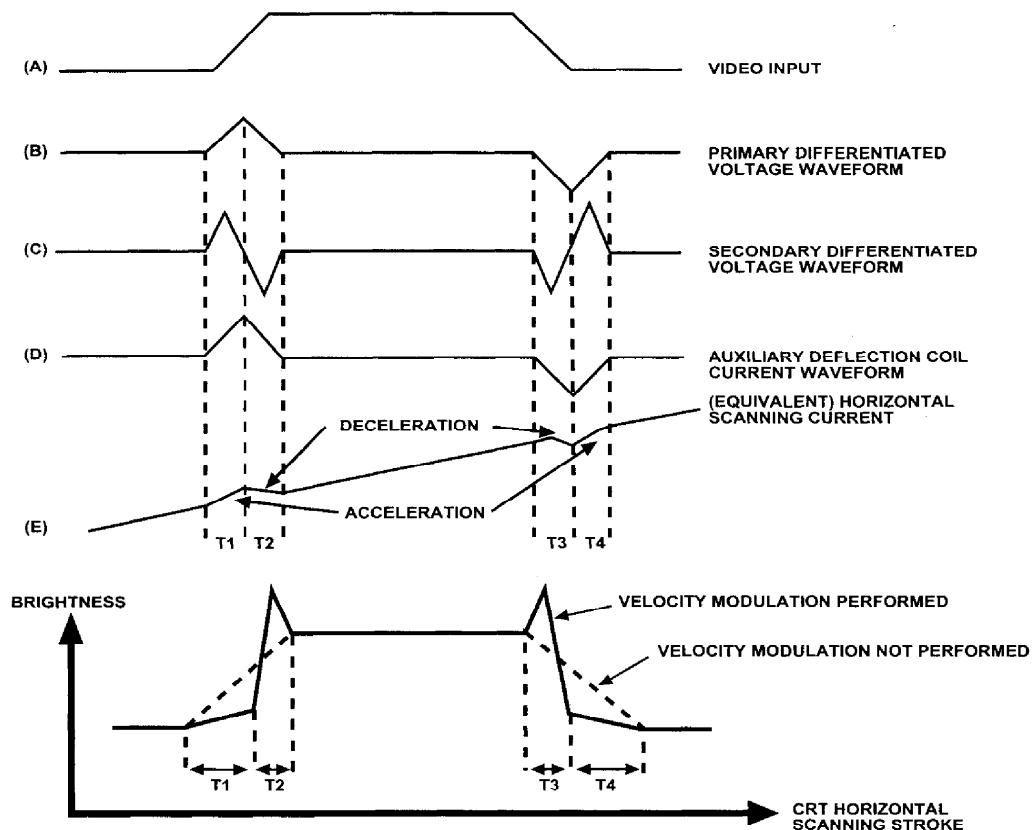

Fig. 11.2 VM Signal Process

12. MTS Decoding (FE-VR50SR)

- 1) Block Diagram See item 1 "Tuner" - MTS Decoding
- 2) Stereo Demodulation The stereo LPF is used to remove the SAP (5fH) and telemetry (6.5fH). The resulting signal is sent to the phase detector. The phase detector converts to a DC voltage and filtered. The 8fH VCO is divided and produces two fH signal, one in phase with the pilot signal and the other 90 degree out of phase.

The signal from the Stereo LPF is also sent to the pilot decoder which converts it to a DC voltage and is stabilized by internal circuit which is used to determine the ON / OFF condition of the Stereo indicator. The Pilot Cancel cancels the pilot signal by adding the stereo signal with matrix signal at the response level of the input pilot signal. The pilot signal is also sent to the L-R signal and the L-R signal goes to the ST/SAP switch.

The L + R LPF consists of 2 traps tuned to fH and 24kHz to remove the L+R signal and passed through a 75us de-emphasis filter to the mode selector.
- 3) SAP Demodulation Block The composite audio signal is also applied to the SAP BPF (peaked to 5fH) to remove the SAP signal. The output of the SAP BPF goes to the SAP Detector. It is full wave rectified to DC voltage and smoothed by the internal circuit. When this DC voltage reaches a certain level, SAP signal is detected.

13. Audio Signal Processing

1 Audio Signal Select

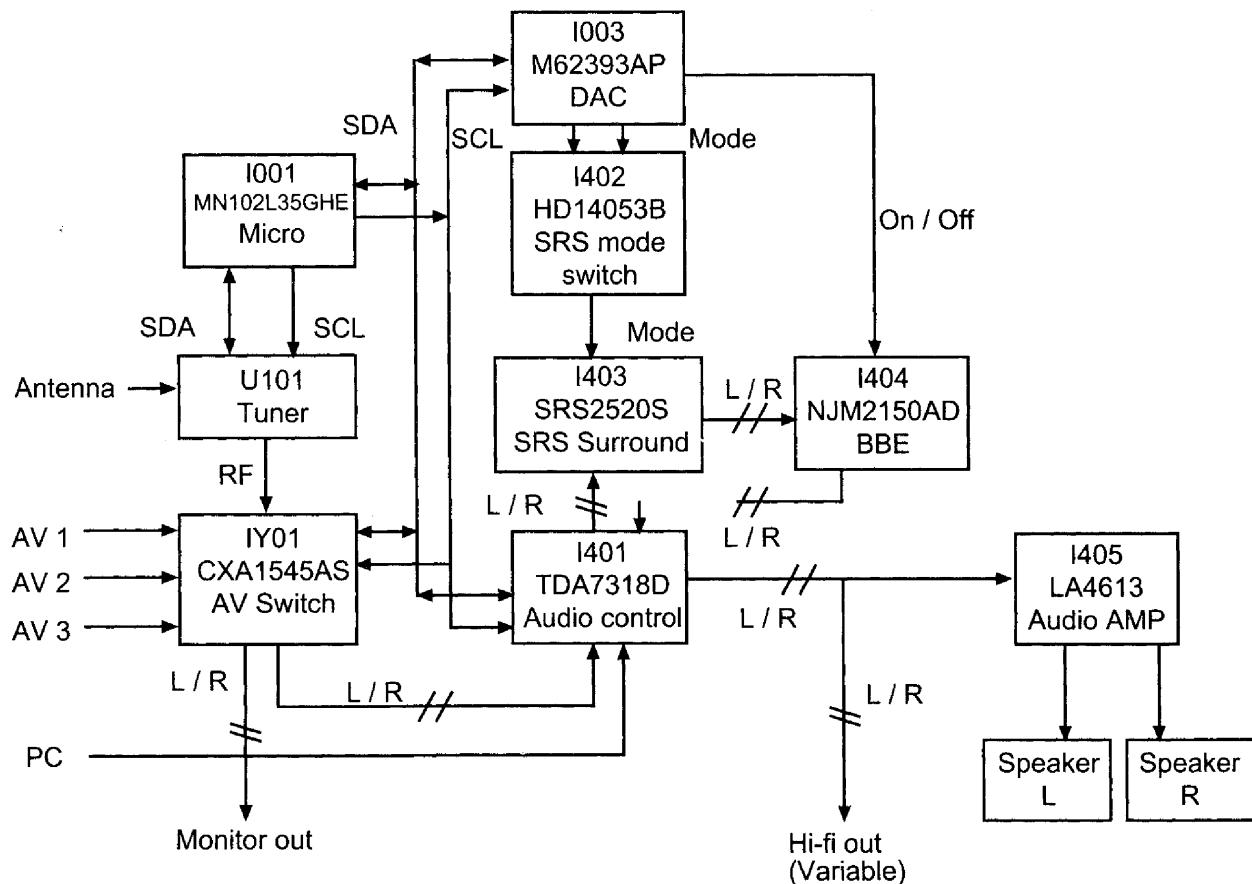

The audio L and R signals from tuner U101, the AV 1 L and R signals, the AV 2 L and R signals, and the AV 3 L and R signals are switched by IY01 (CXA1545AS) on the NTSC PWB. The L-s and R-s are the output signals which are sent to the Audio Control IC 1401 (TDA7318D) and the monitor output jacks. I401 consists of IIC bus controlled amplifiers per channel. These serve to control Volume, and Tone (Bass / Treble). The L and R signals from IY01 and the PC L and R signals are switched by I401 (TDA7318D) on Audio PWB. The L-s and R-s are the output signals which are sent to the SRS Surround IC I403.

2 SRS Surround

I403 (SRS5250AS) is the SRS surround processor. SRS ON / OFF is controlled by I402 (HD140539).

3 BBE

I404 (NJM2150AD) is BBE sound enhancement processor. BBE ON / OFF is controlled by IIC bus from I001.

14. 3 Dimension Comb Filter Unit

The 3 Dimension Comb Filter Unit Block Diagram is shown in Fig. 14.1.

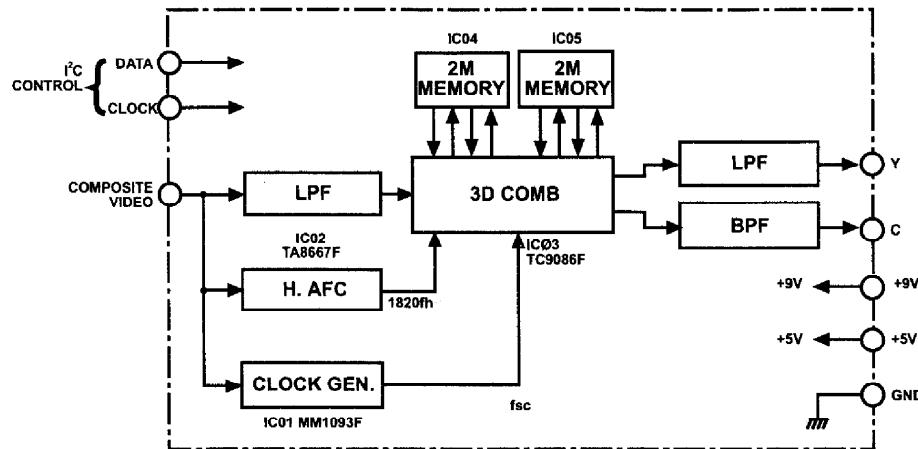

Fig. 14.1 3 Dimension Comb Filter Unit Block Diagram

The 3 Dimension Comb IC (IC03) Block Diagram is shown in Fig. 14.1.

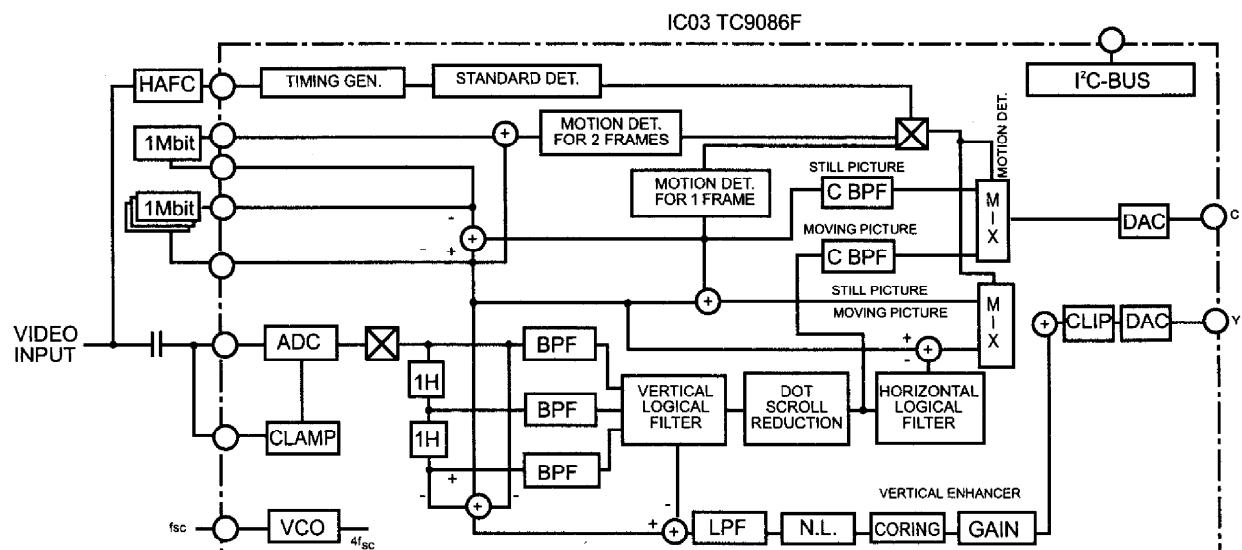

Fig. 14.2 3 Dimension Comb IC Block Diagram

The TC9086F is a motion adaptive 3 Dimension Y/C Separation System. This system detects the amount of moving picture information and processes this information for the still portion and moving portion of the picture. For still portions, 3 Dimension Y/C Separation with field memory is executed. For moving portions, Dynamic Comb Filtering Y/C Separation between 3 lines is executed.

TROUBLESHOOTING

PRODUCT SAFETY NOTE

The shaded and  marked components have special characteristics important to safety.
Read carefully the product safety notice of each service manual. Don't degrade the safety
of the receiver through improper servicing when replacing any of this components.

HOW TO USE FLOW CHART

(1) The flow chart shows the following:

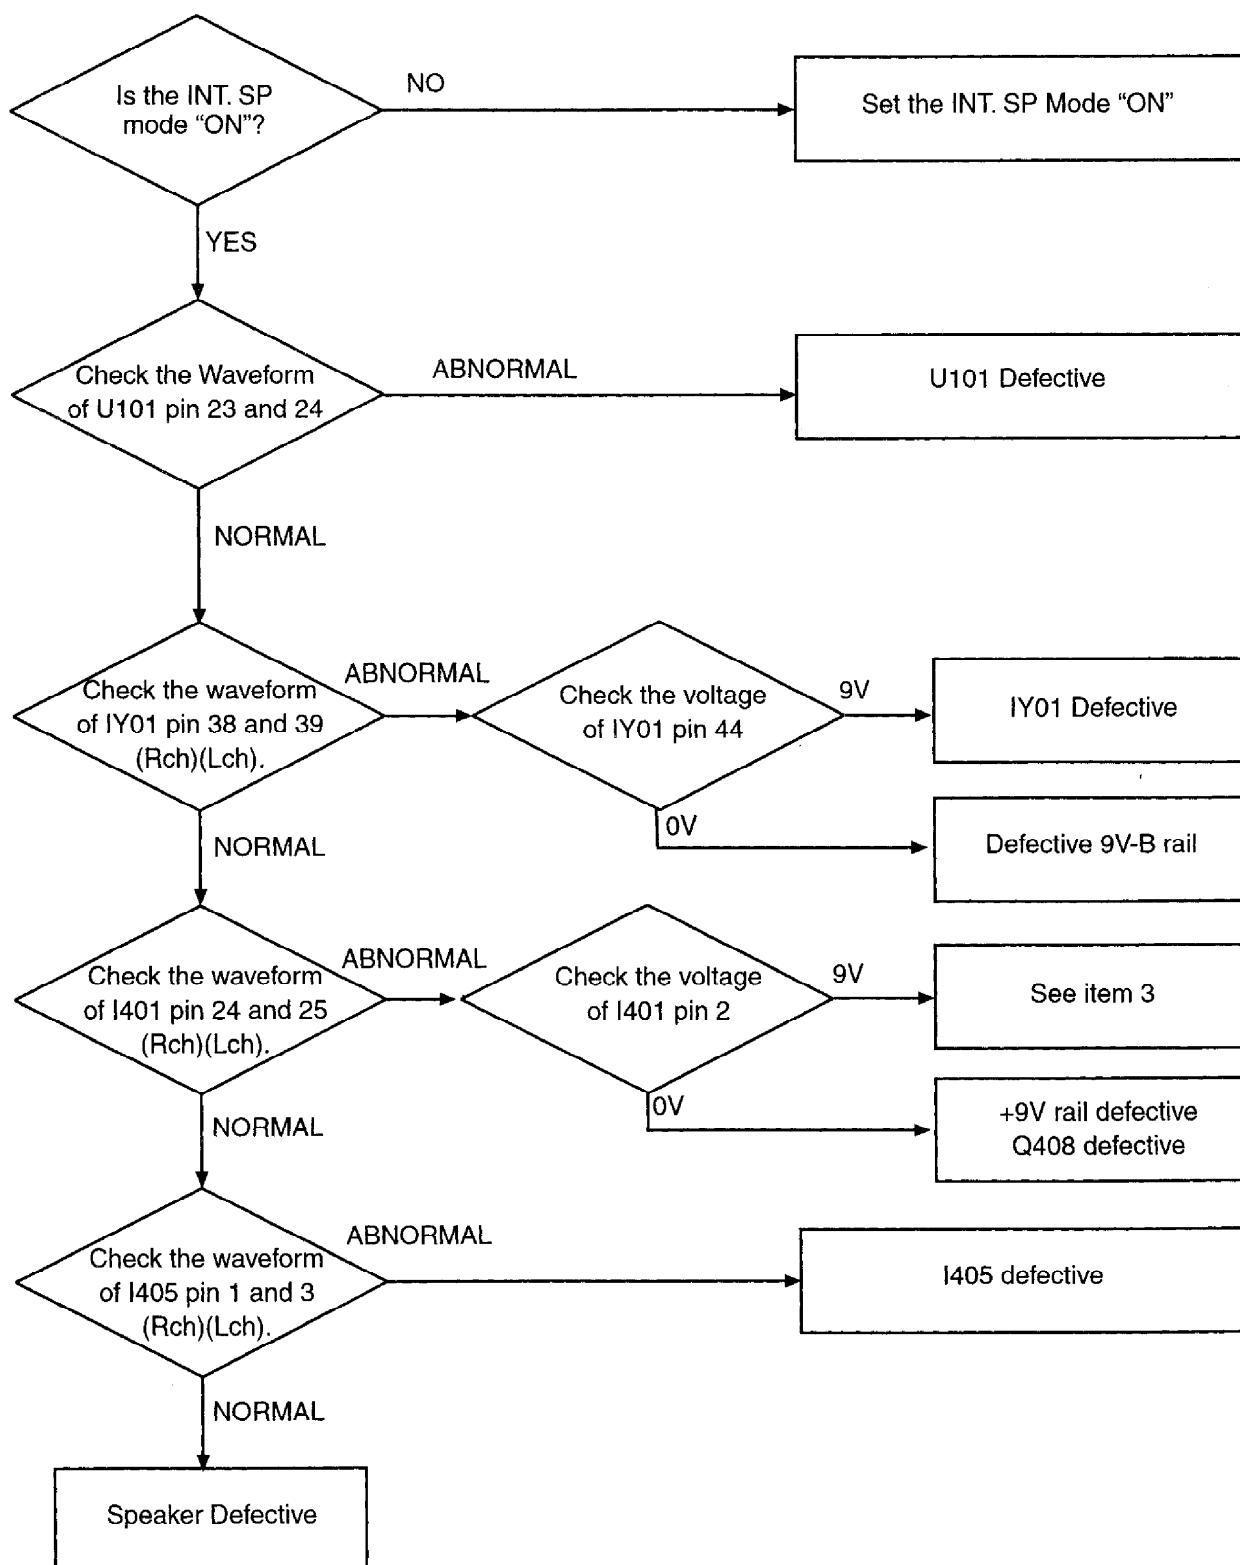

(2) The voltage shown in the chart may differ to some extent depending on the condition of the set and tester.

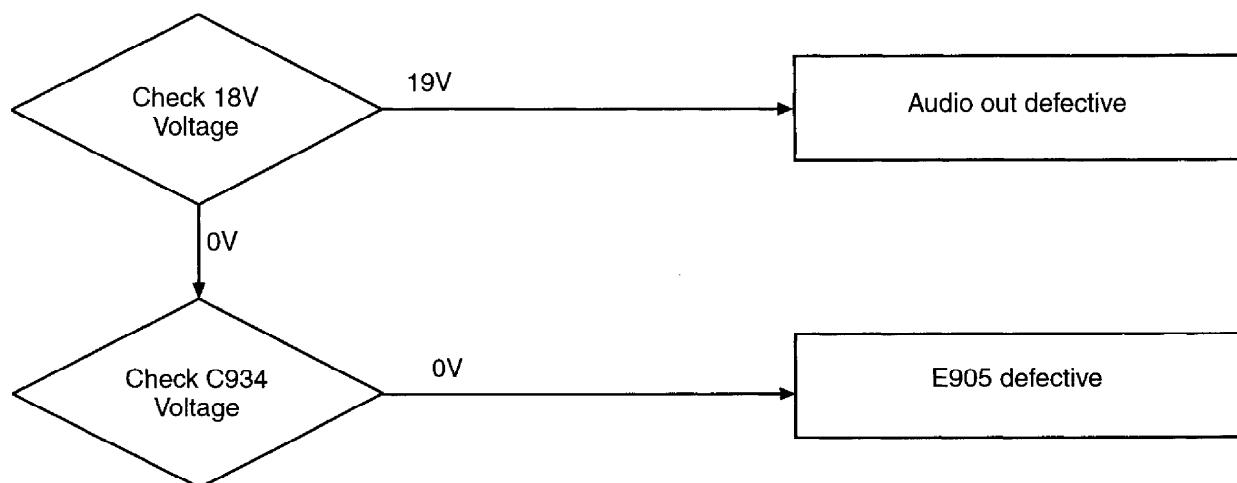

PRECAUTION ON MAKING MEASUREMENTS AND ON HANDLING

1. When any parts become abnormally hot or there is a smell of burning, cut off the power immediately.
2. Do not make shorts between circuits or across terminals except for those specified.
3. When measuring the voltages of ICs and TRs, be careful that the test lead of the tester does not touch any other terminal.
4. Measure the voltage correctly.
5. Measure the resistance over a small range.
6. Be sure to switch off the power when replacing parts.
7. Do not apply a soldering iron for a long time when replacing parts. (Use a solder-wick.)
8. Use an isolation transformer when troubleshooting.

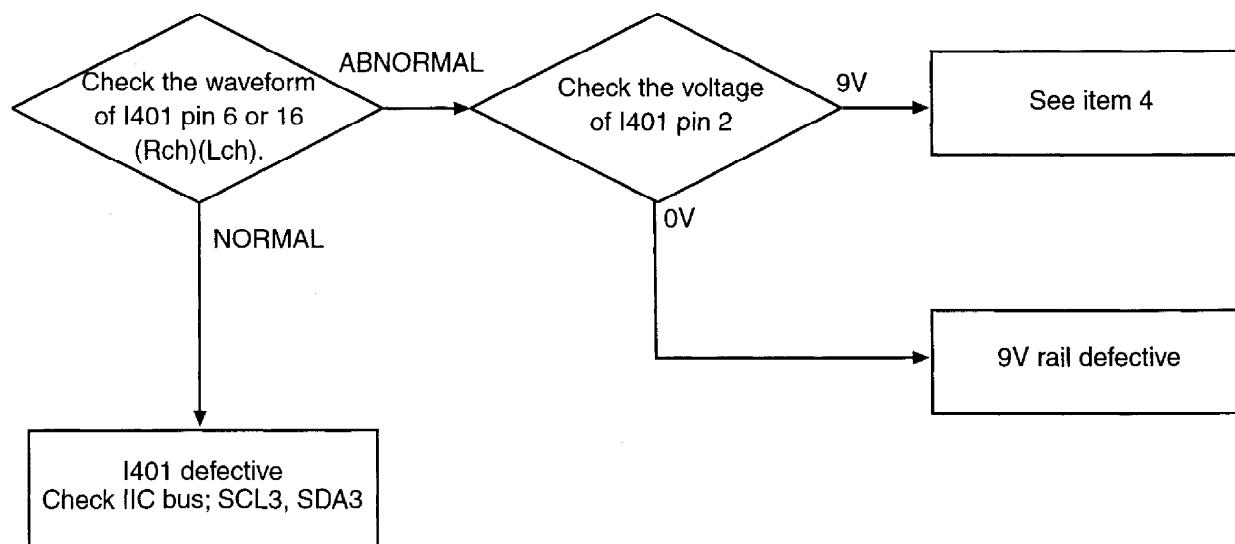

1. No Sound

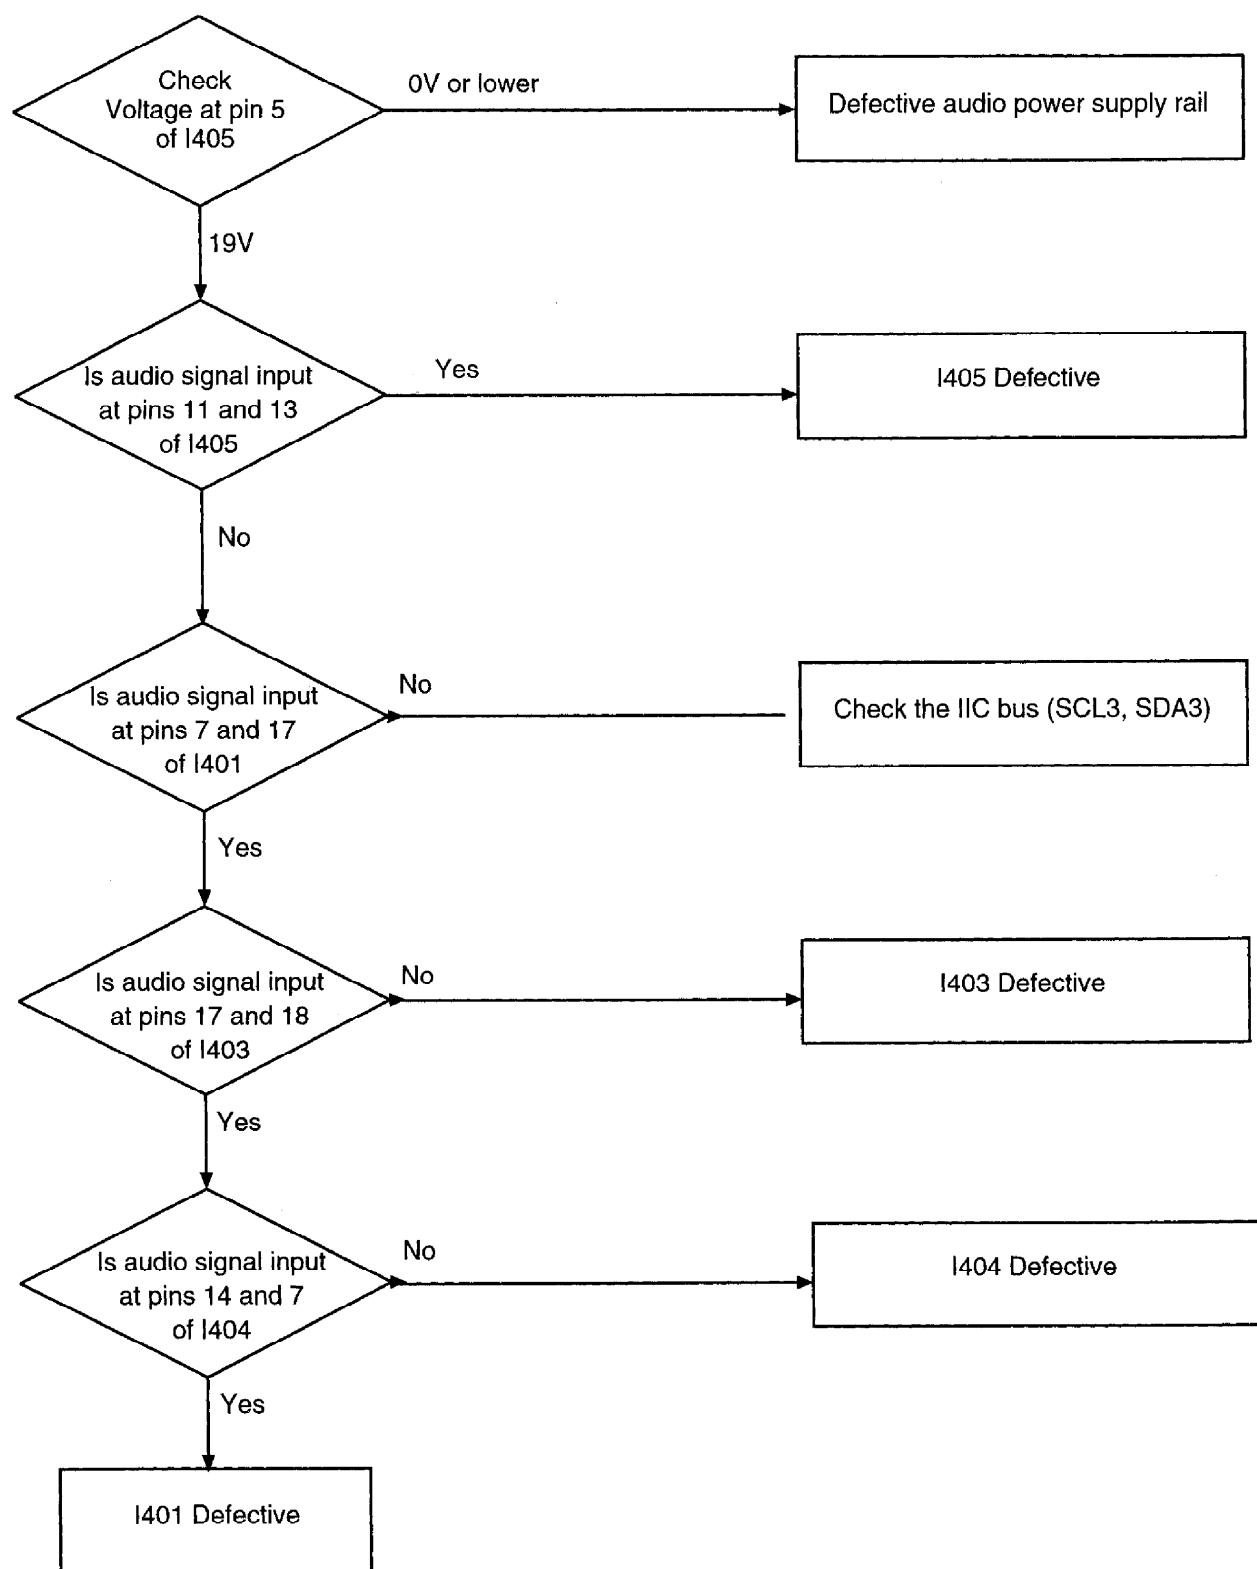

2. No Sound (No Audio Power)

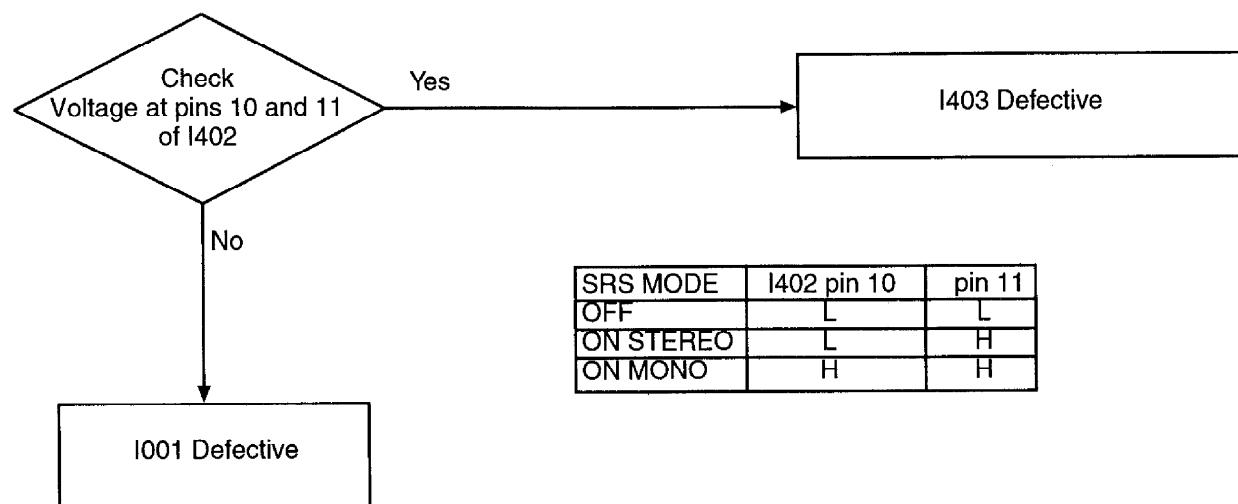

3. No sound or not variable (Bass, Treble)

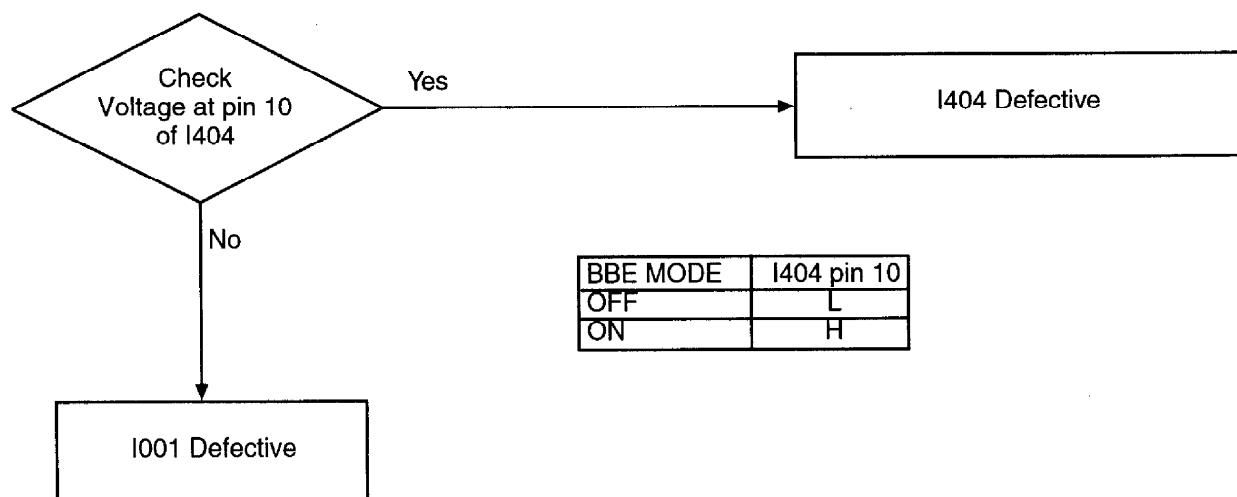

4. No Sound

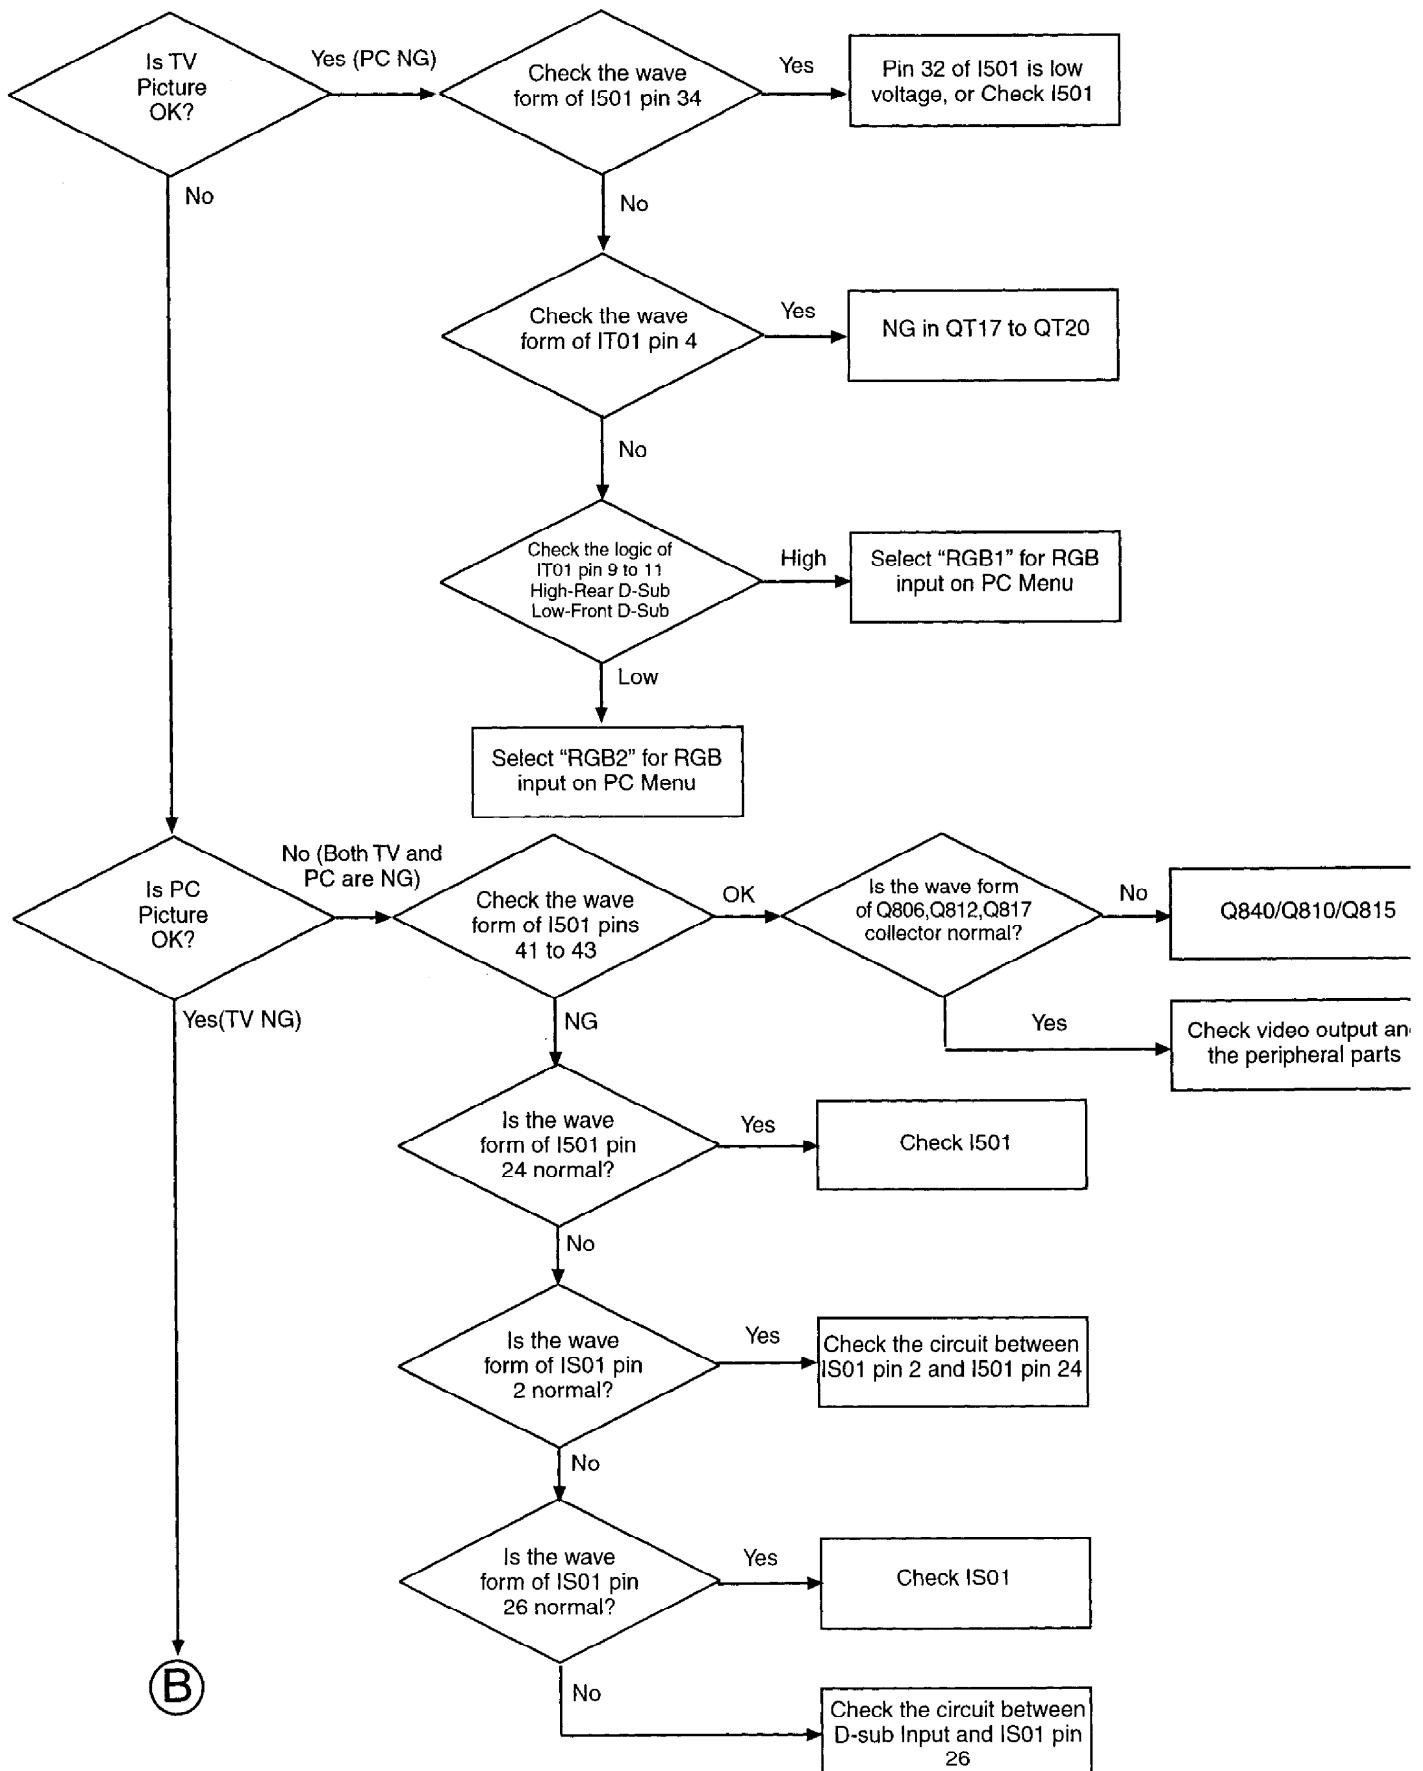

5. No SRS

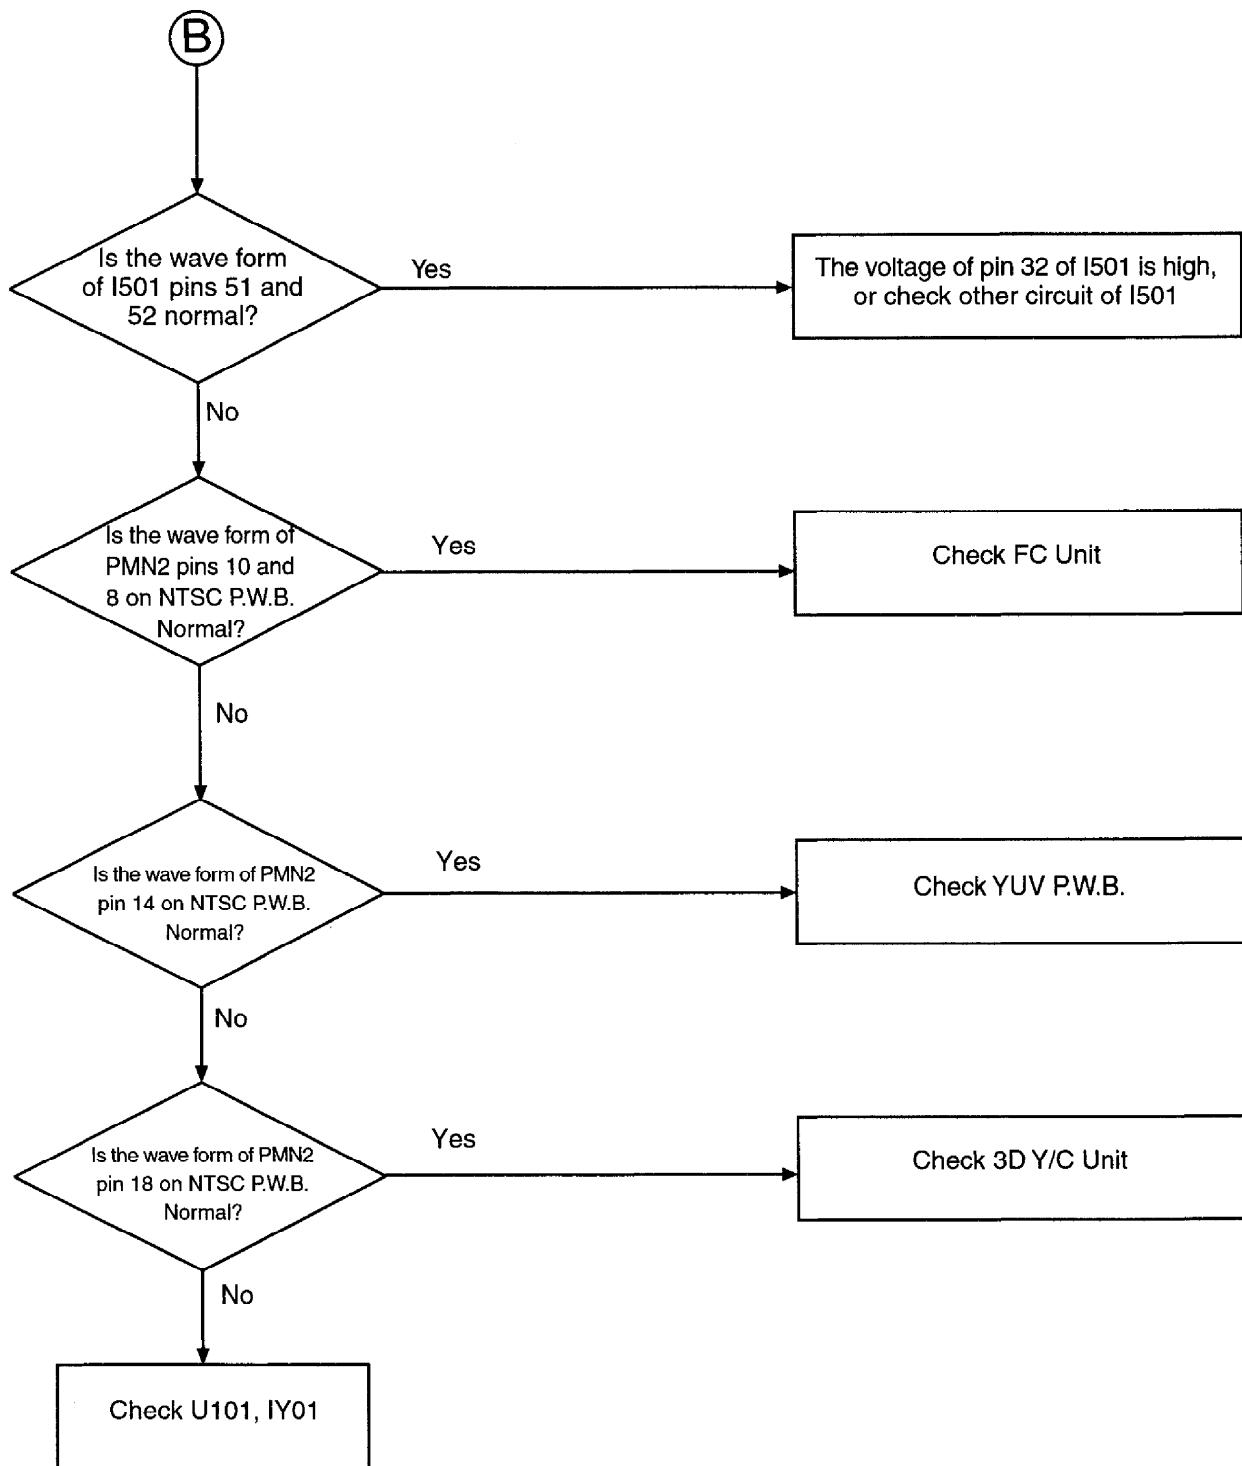

6. No BBE

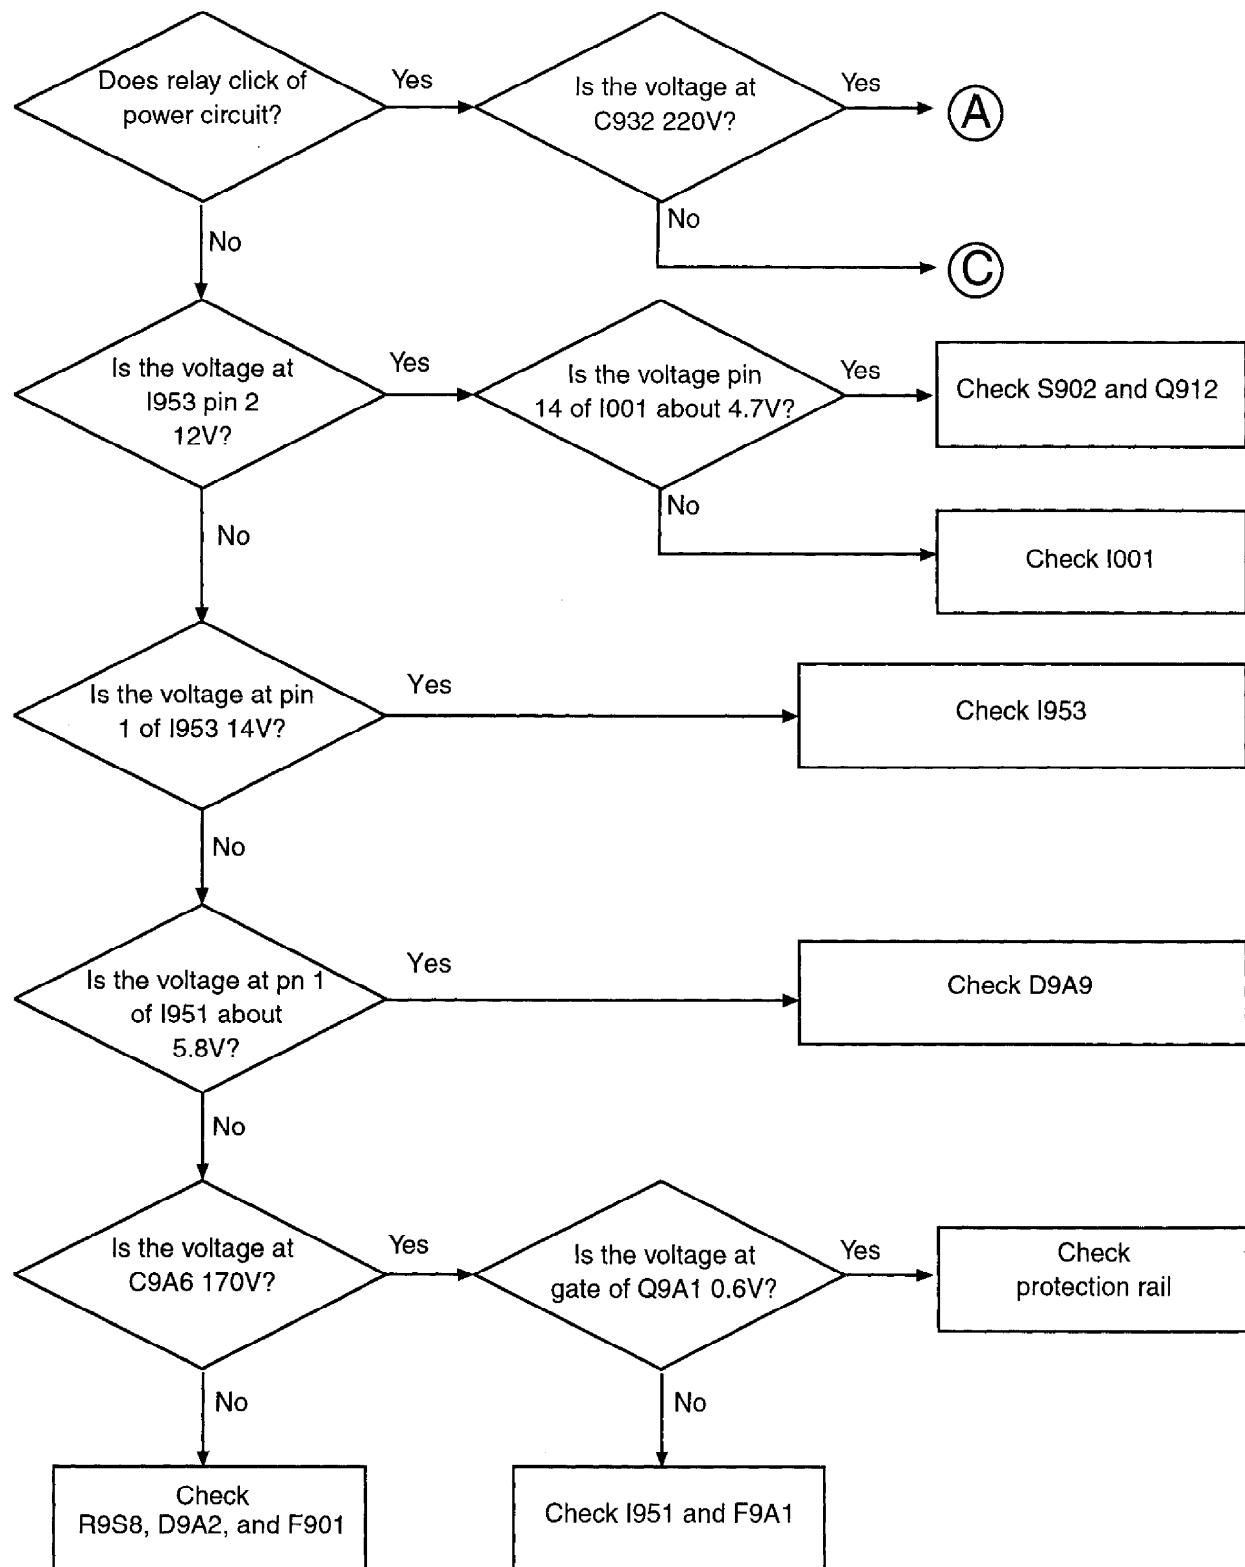

7. No Picture (Raster OK)

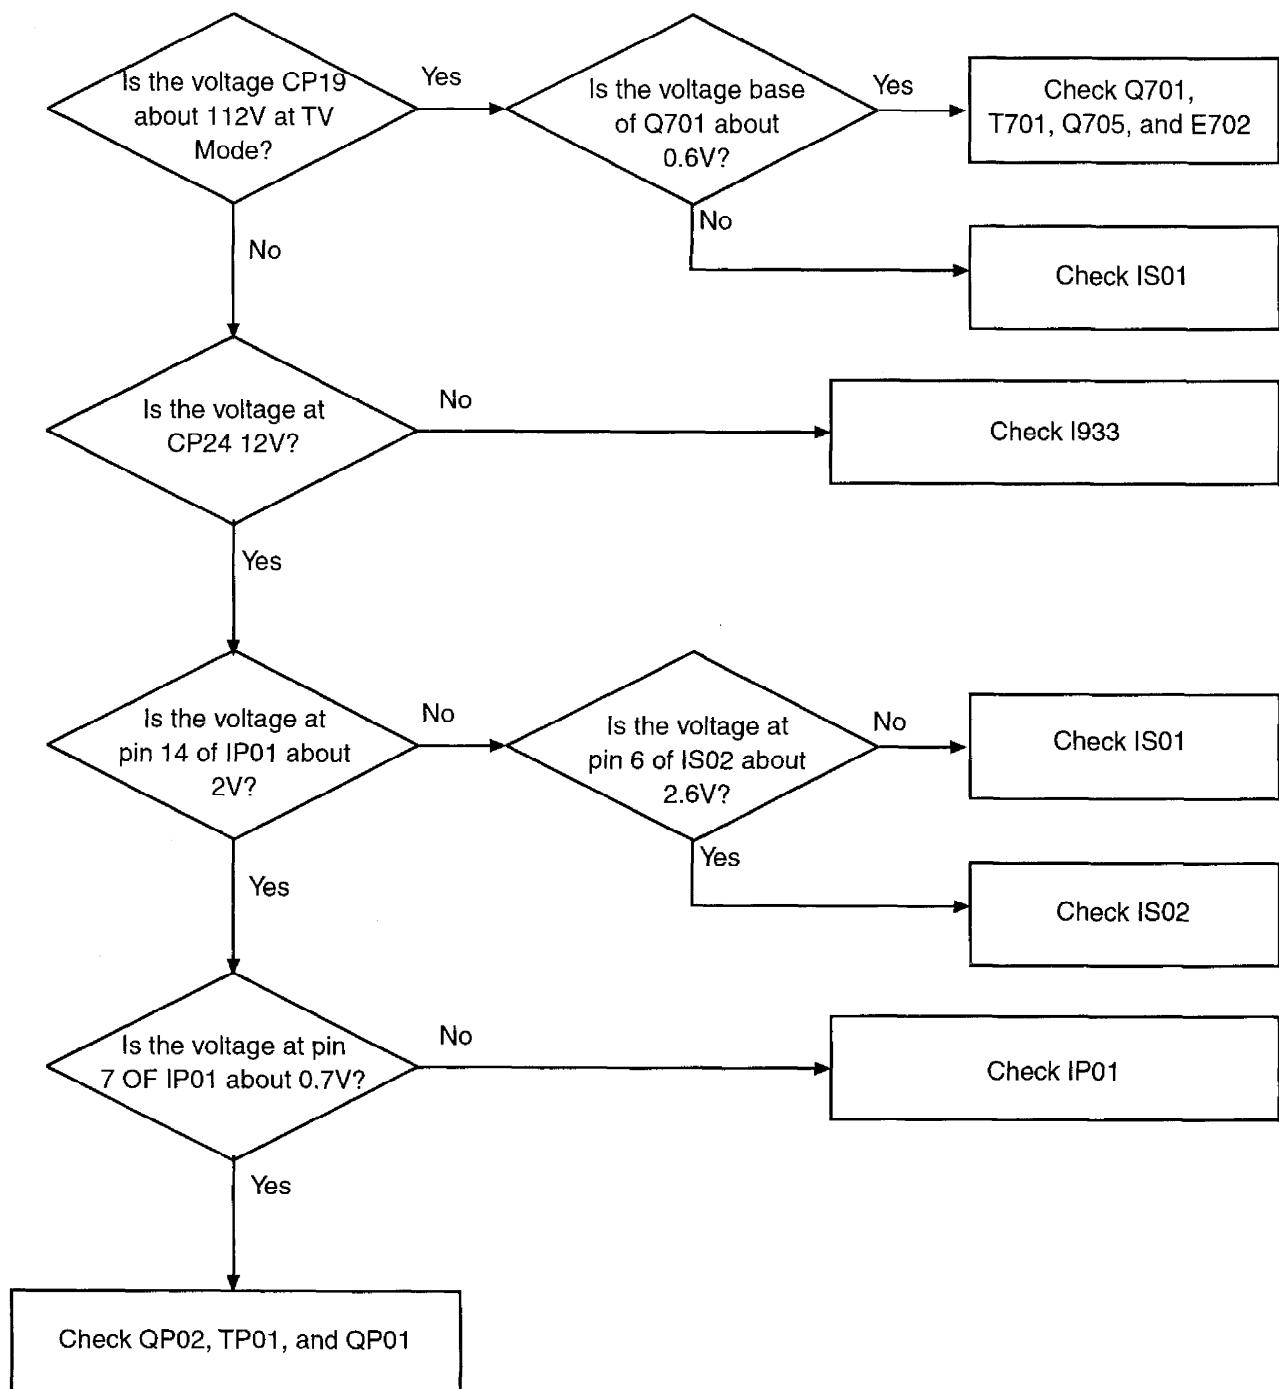

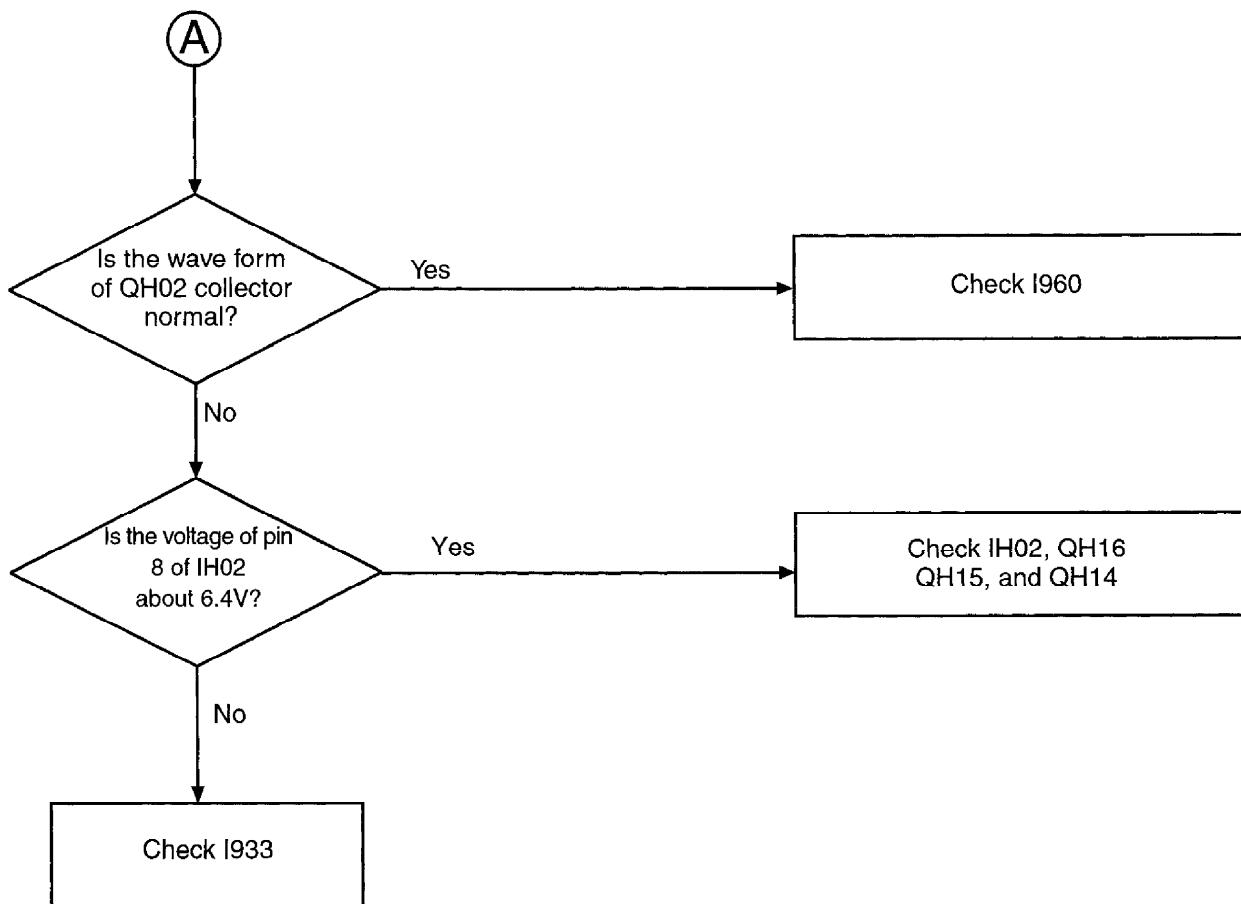

8. No Raster

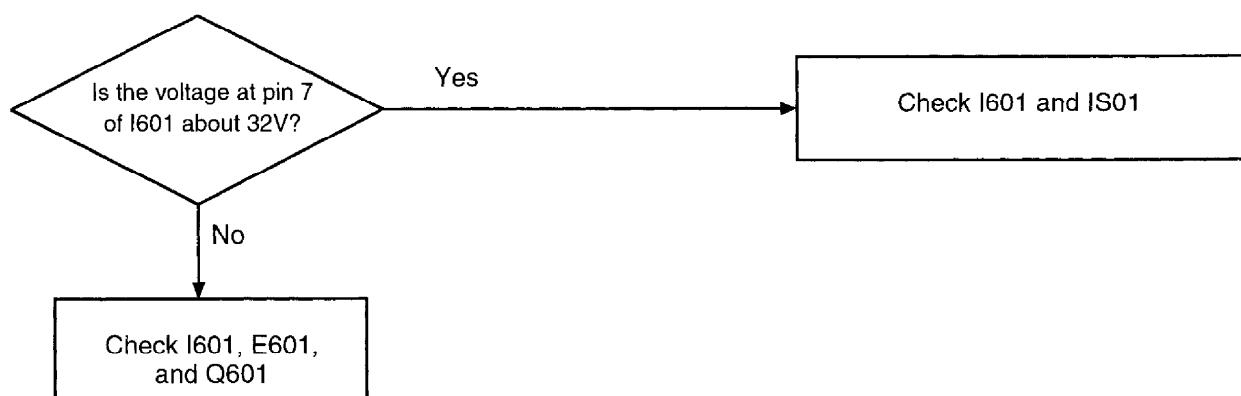

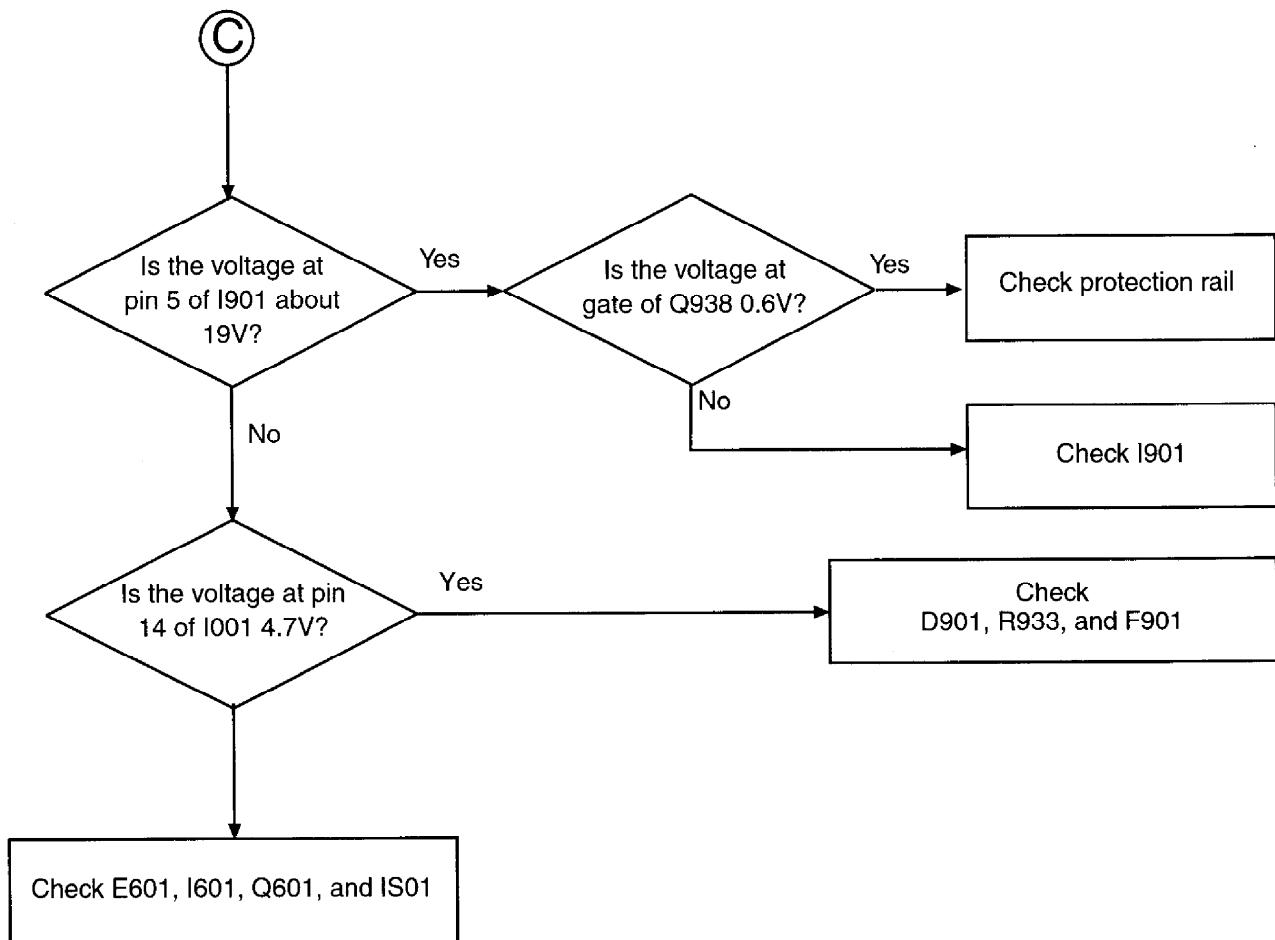

9. No Horizontal Raster

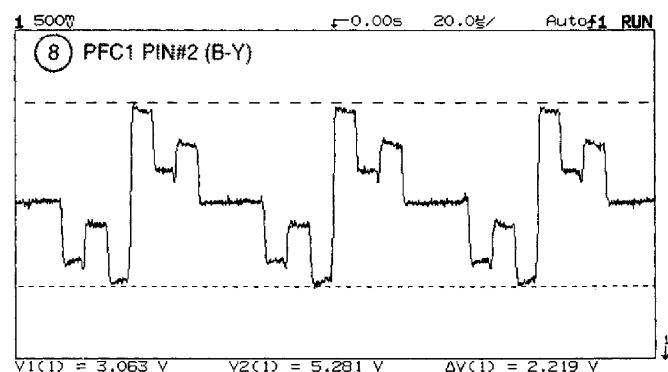

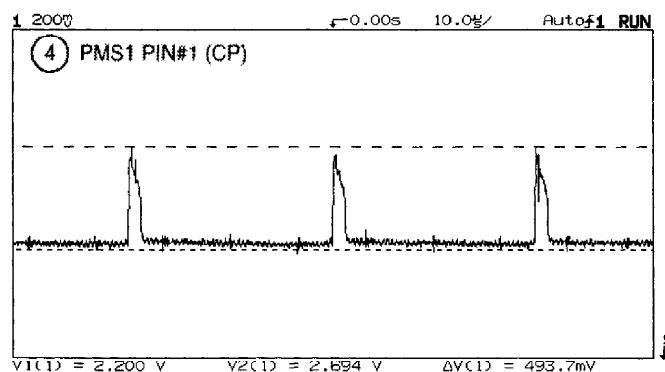

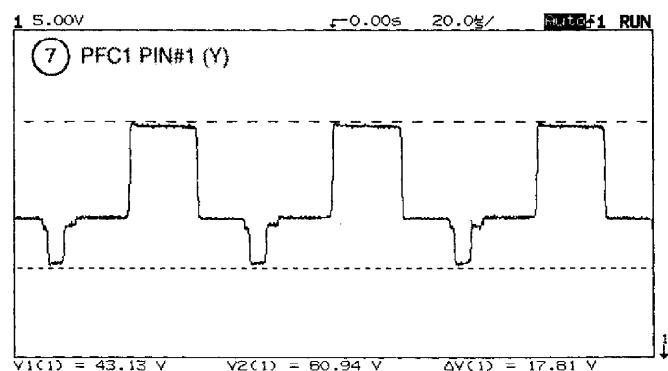

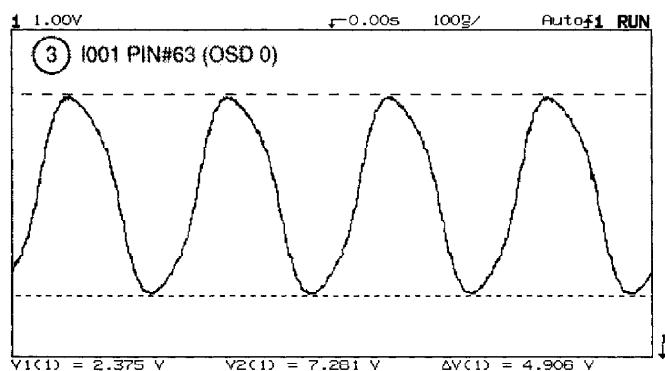

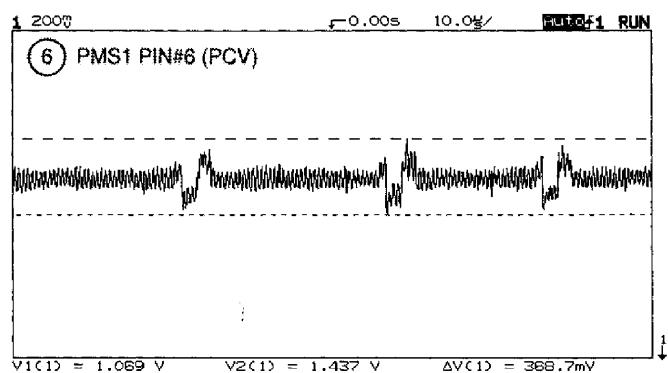

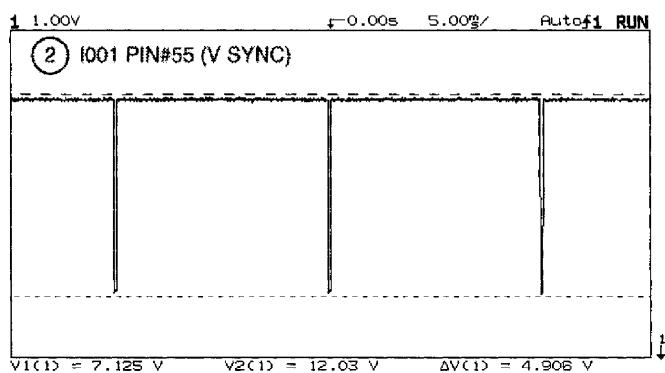

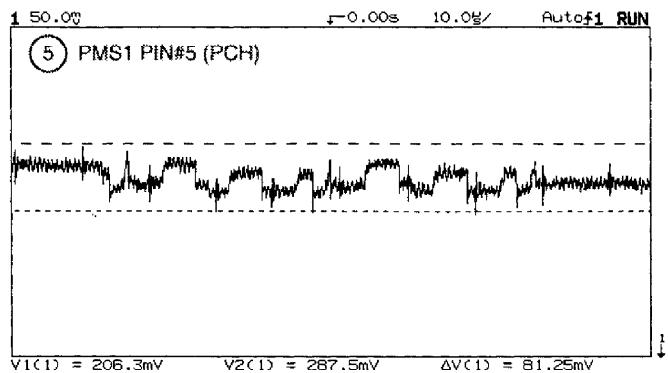

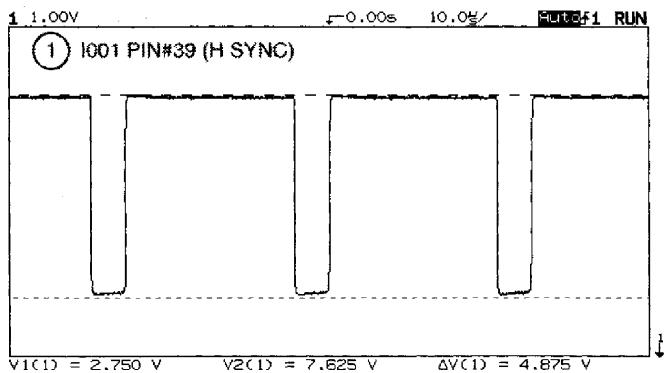

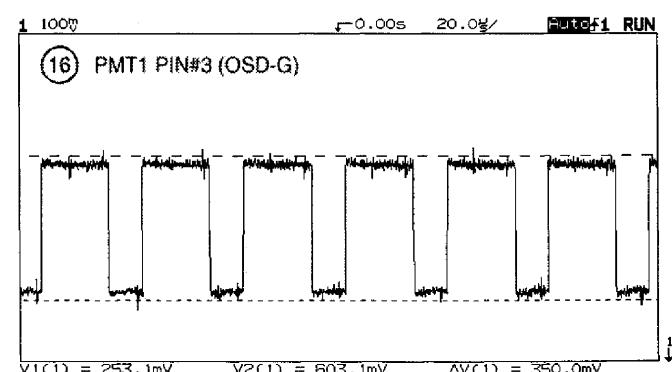

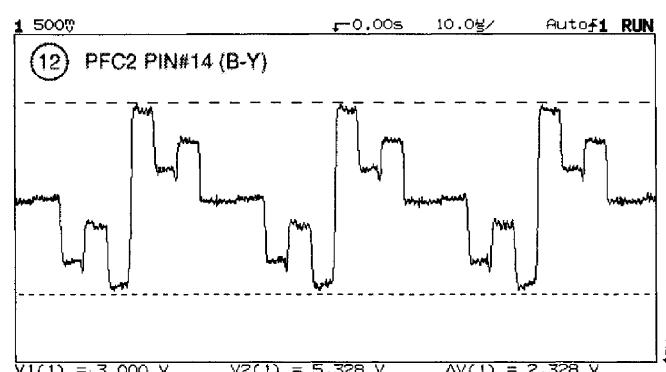

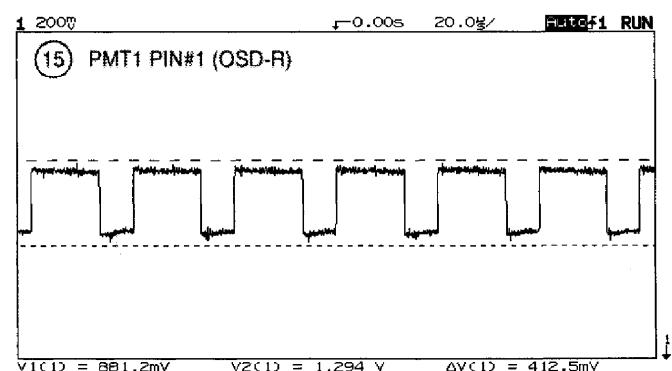

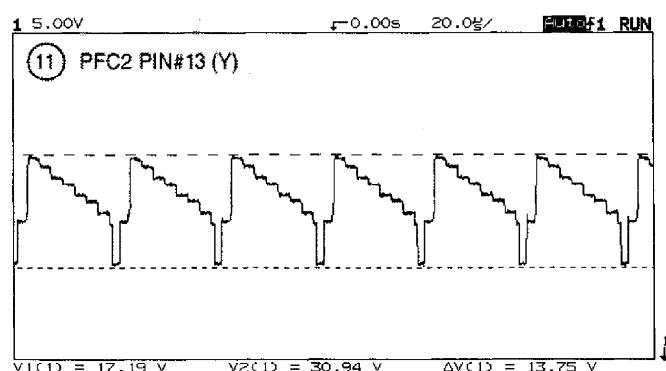

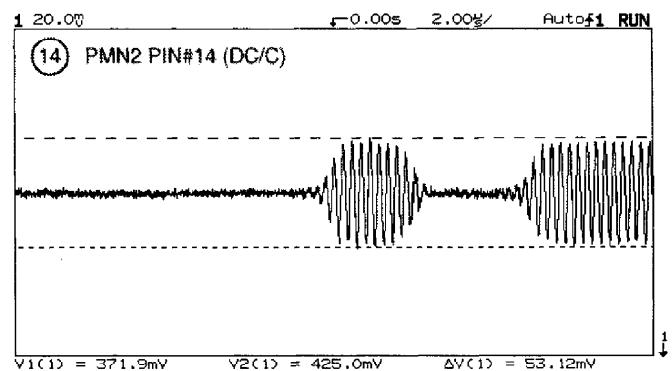

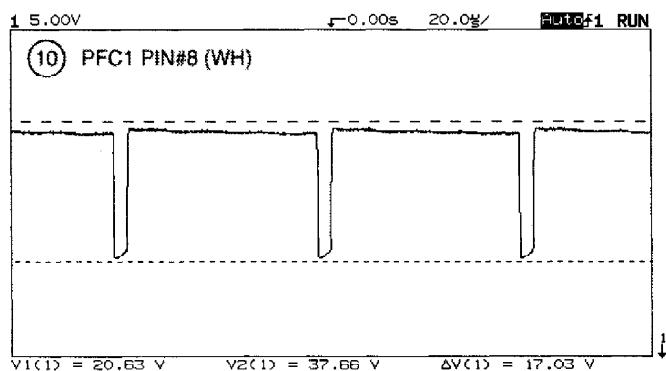

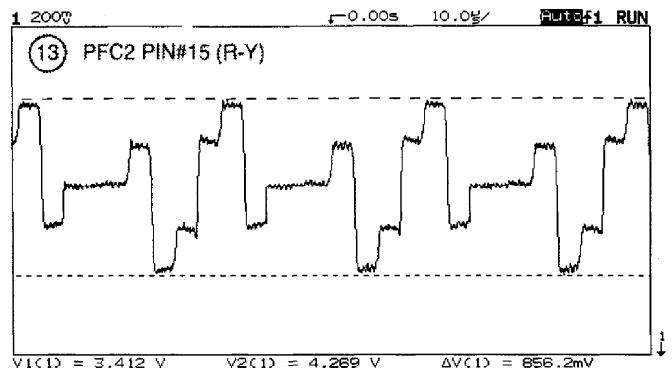

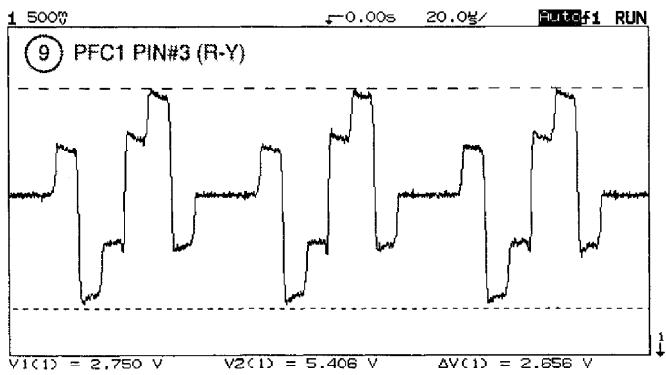

10. No Vertical Raster

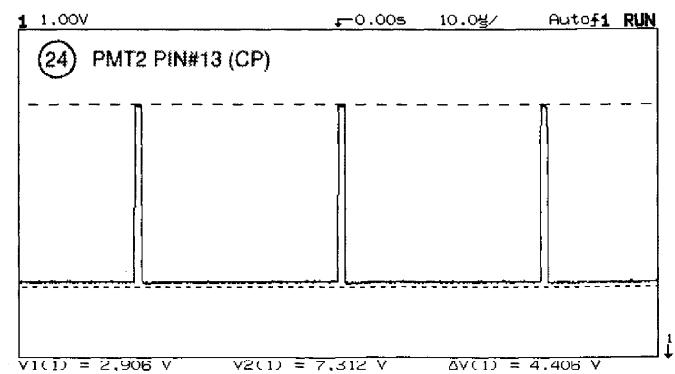

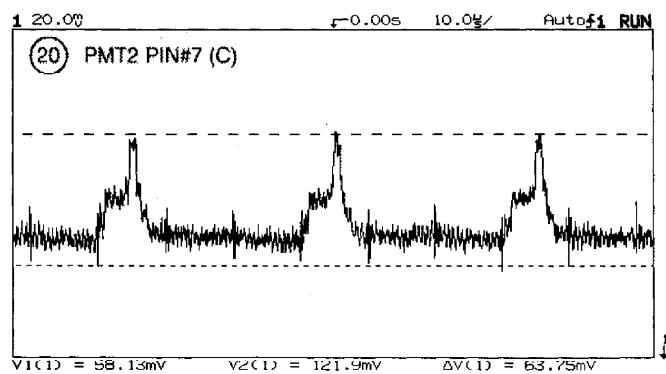

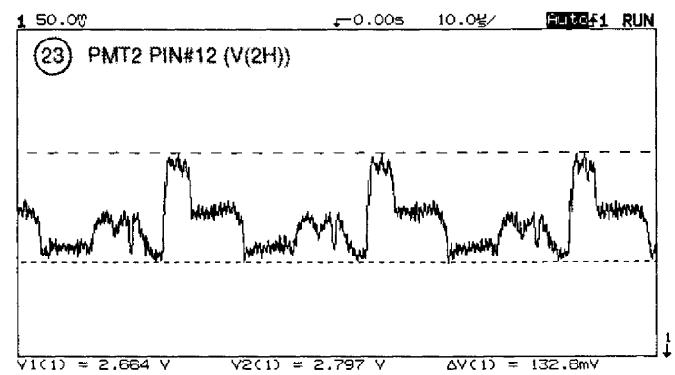

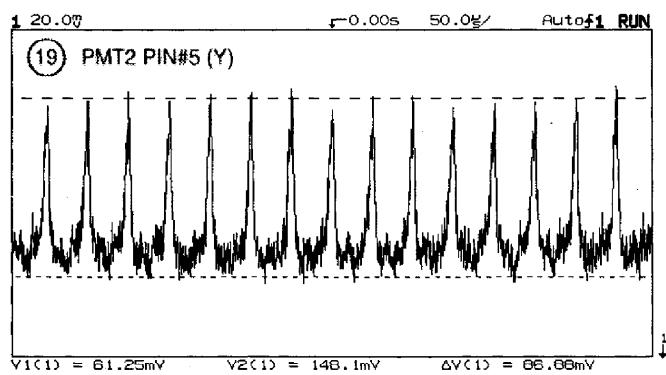

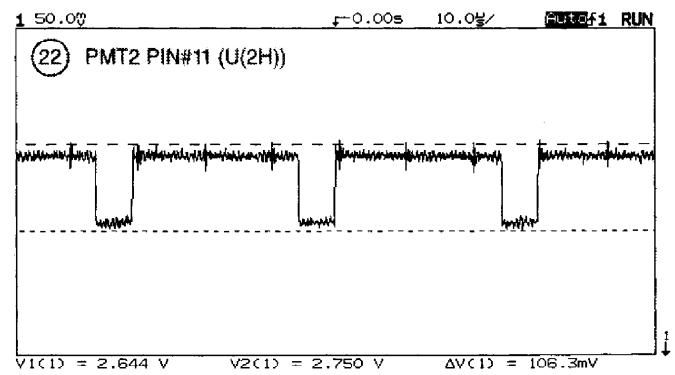

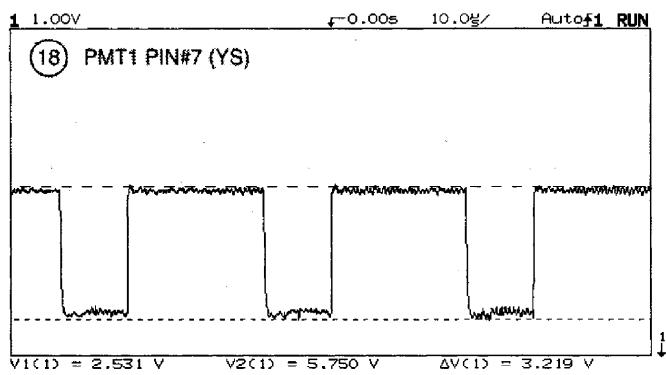

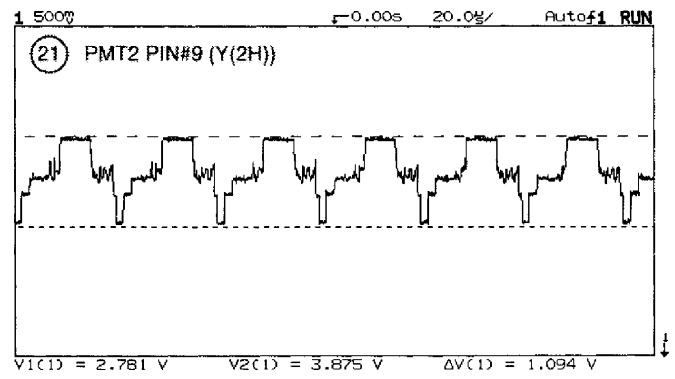

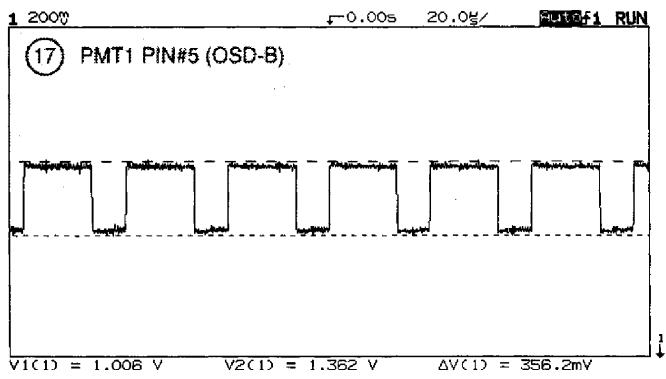

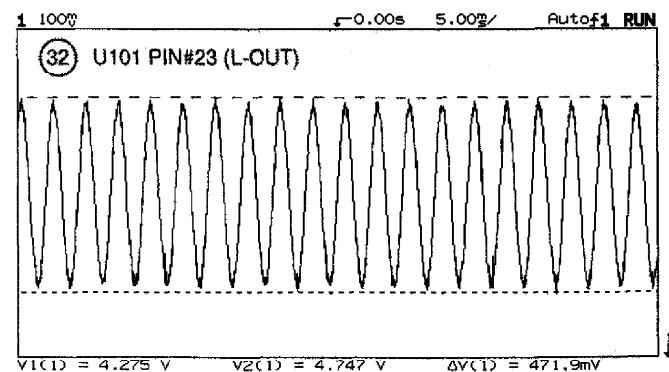

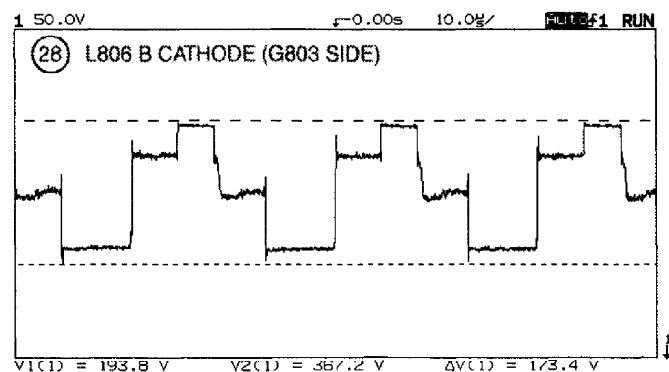

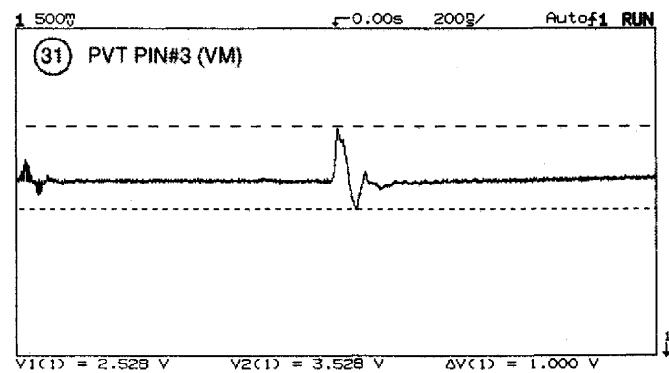

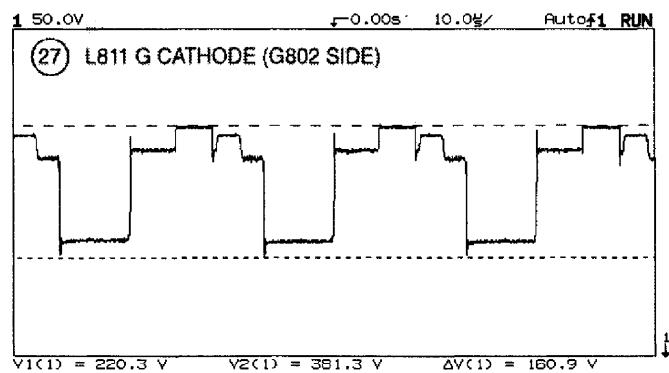

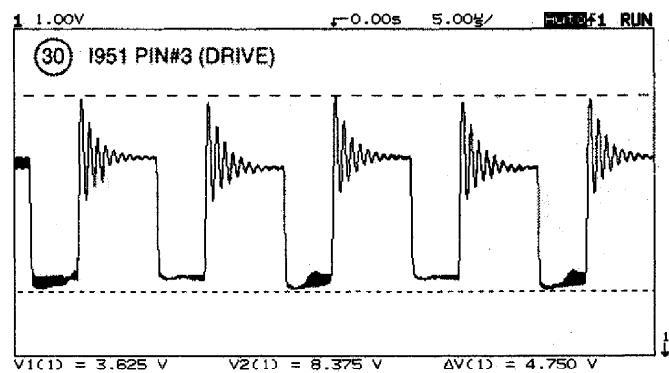

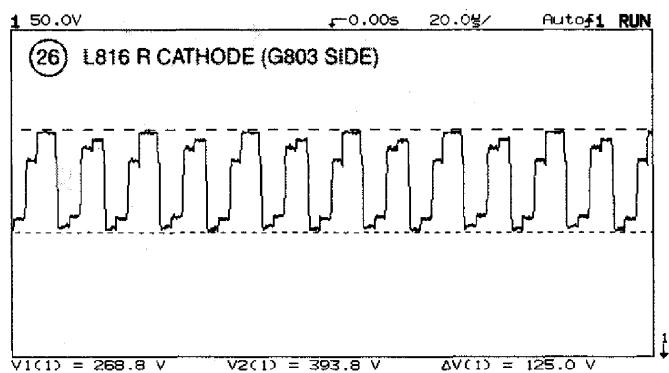

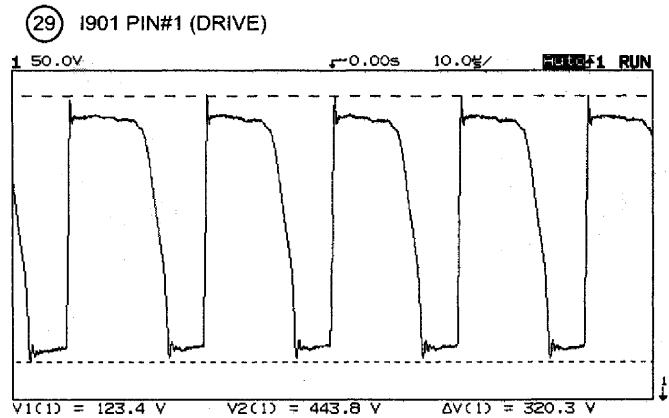

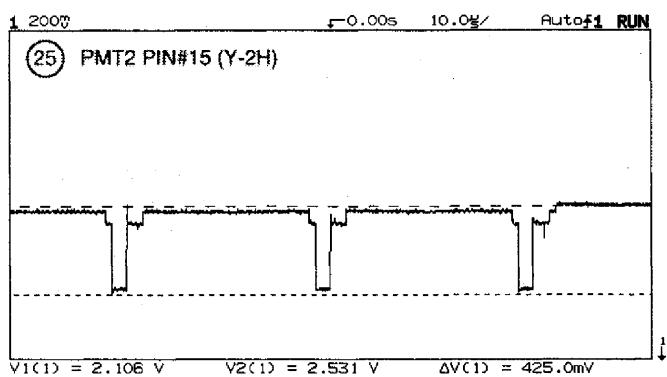

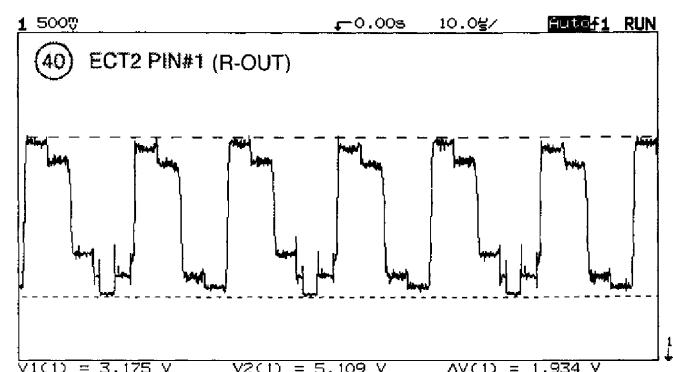

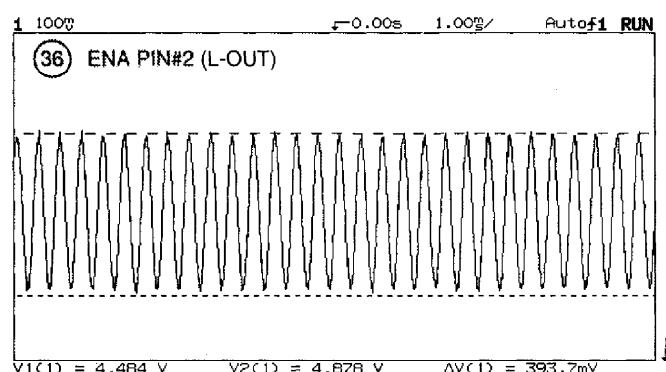

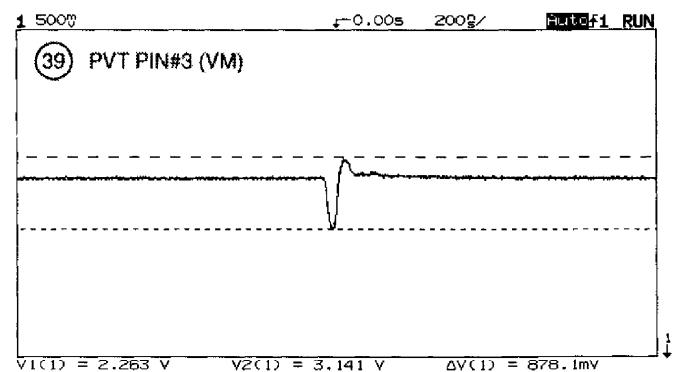

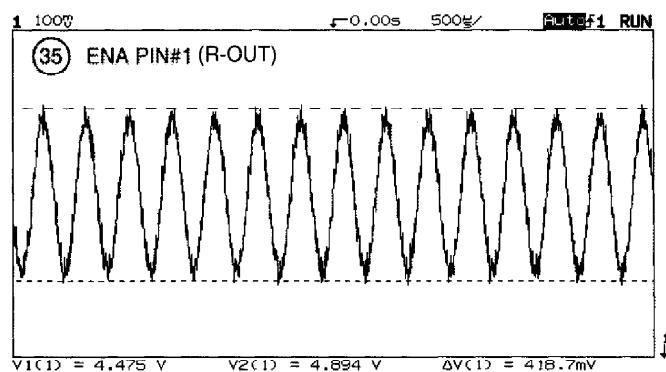

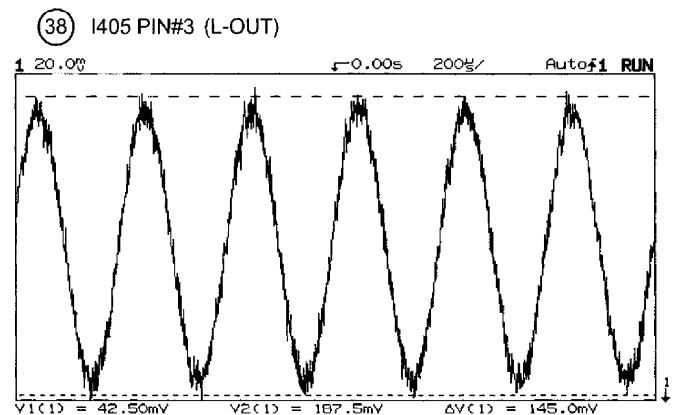

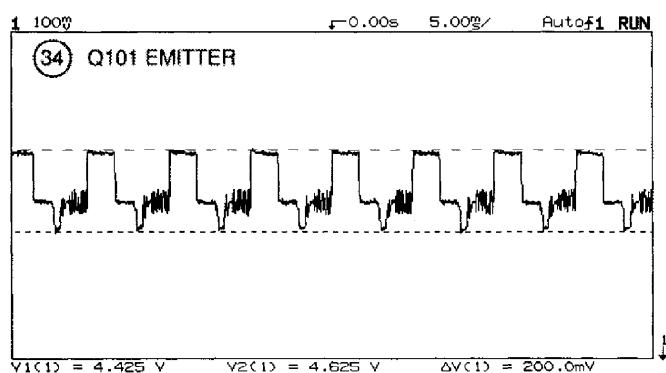

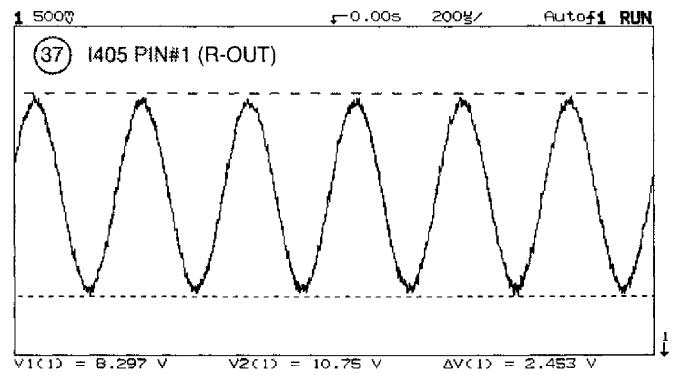

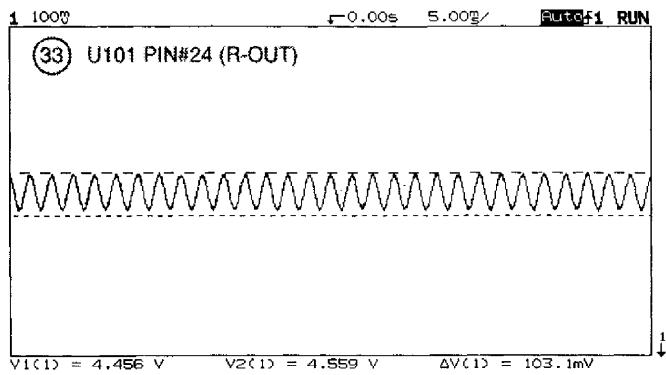

Waveforms

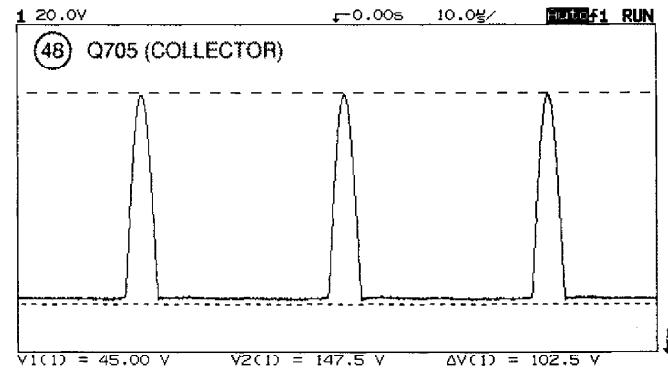

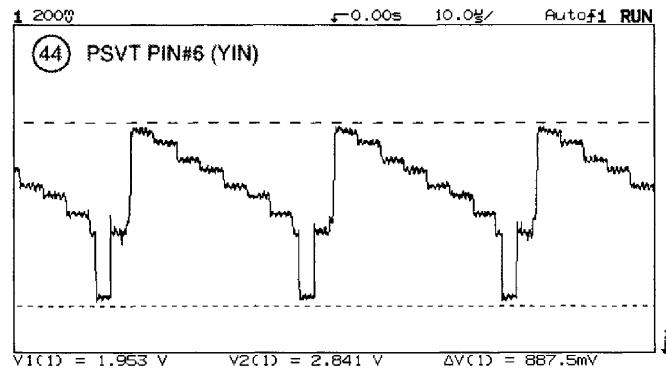

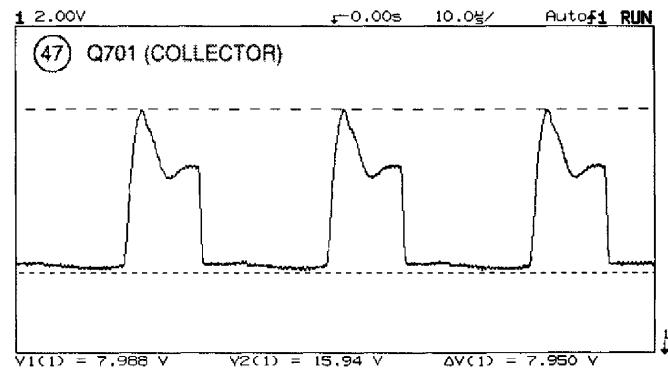

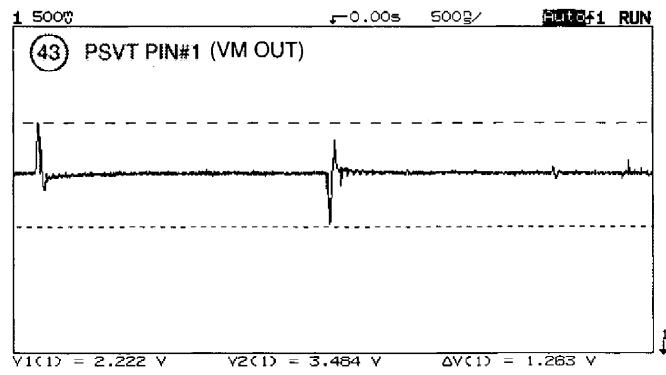

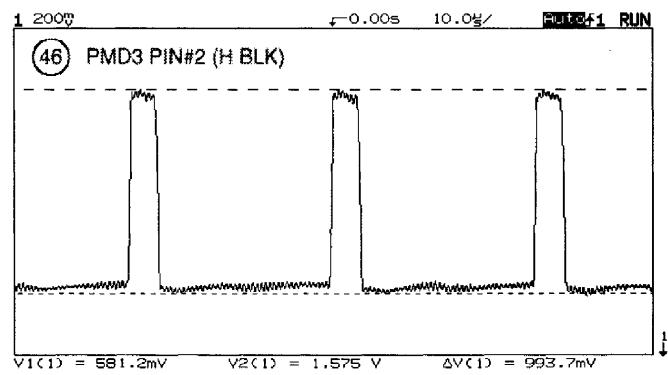

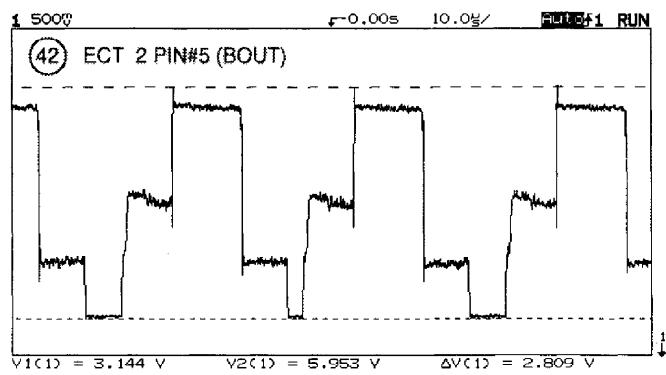

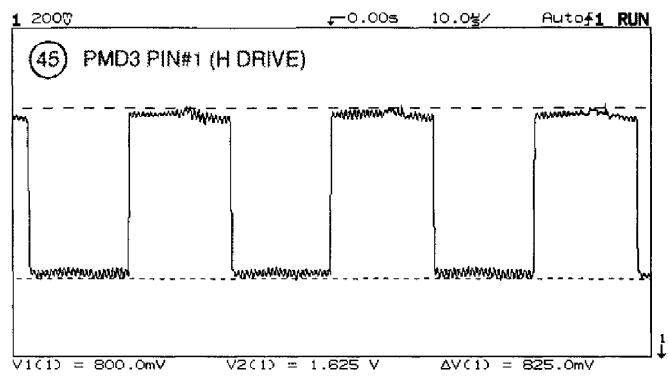

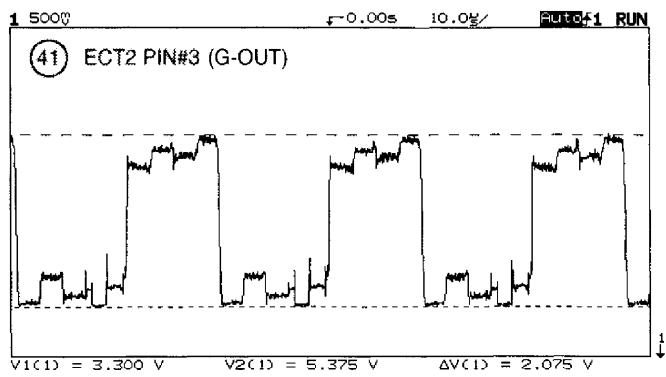

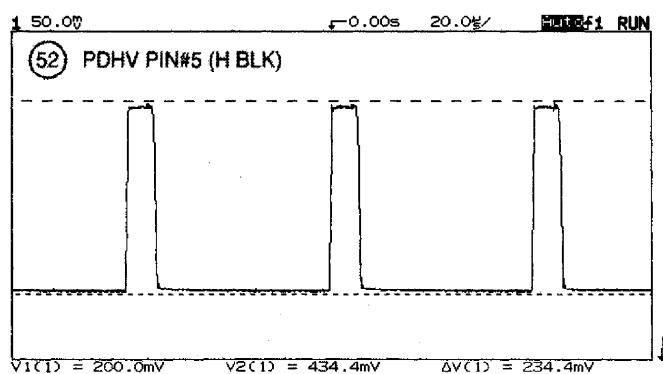

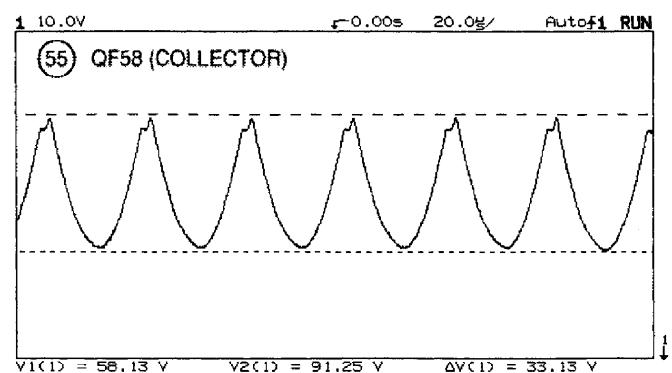

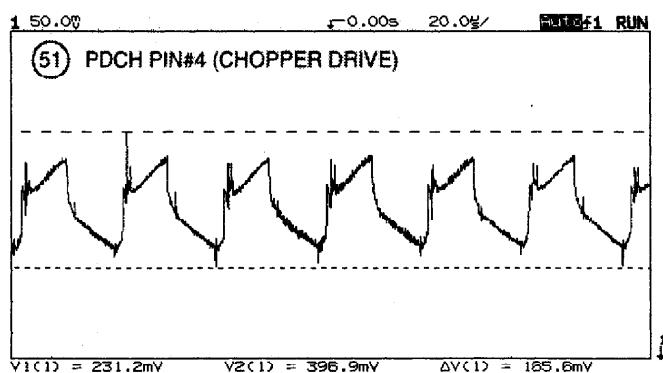

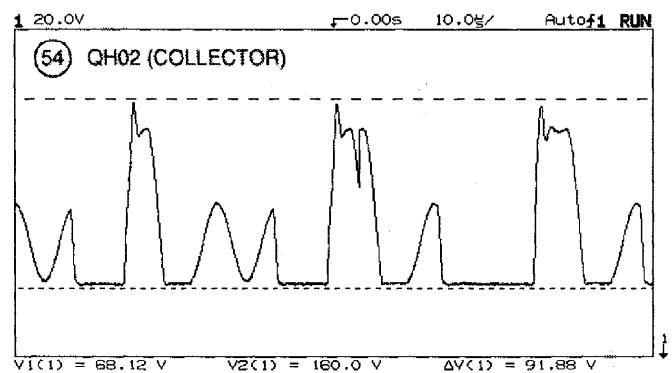

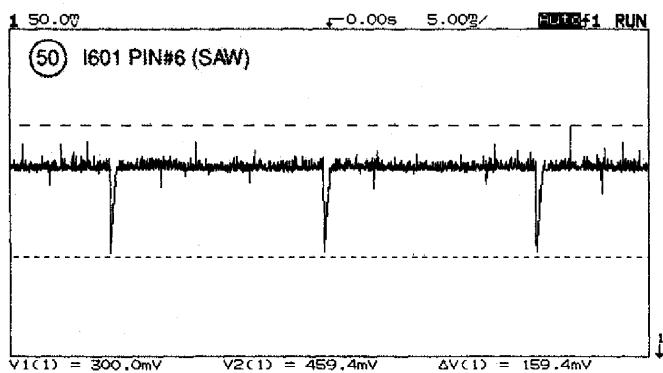

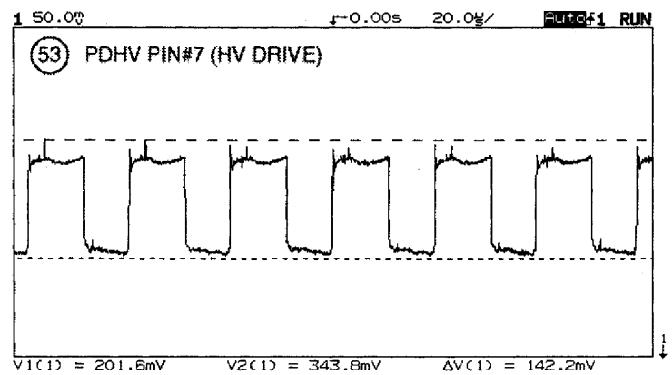

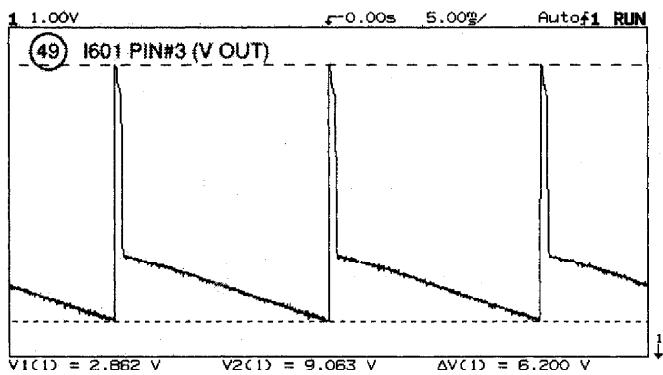

REPLACEMENT PARTS LIST

PRODUCT SERVICE NOTE: Components marked with a  have special characteristics important to safety. Before replacing any of these components, read carefully, the PRODUCT SAFETY NOTICE of this Service Manual. Don't degrade the safety of the receiver through improper servicing.

ABBREVIATIONS

Capacitors:

CD: Ceramic Disc
 PF: Polyester Film
 EL: Electrolytic
 PP: Polypropylene
 PR: Paper
 TA: Tantalum
 TM: Trimmer
 MC: Mylar

Resistors:

CF: Carbon Film
 CC: Carbon Composition
 MF: Metal Oxide Film
 VR: Variable Resistor
 WW: Wire Wound
 FR: Fuse Resistor
 MG: Metal Glaze

Semiconductors:

TR: Transistor
 DI: Diode
 ZD: Zener Diode
 VA: Varistor
 TH: Thermistor
 IC: Integrated Circuit

WIRING DRAWING OF 36SDX88B/MM1 FINAL ASSEMBLY

WIRING DRAWING OF 36SDX88B/MM1 MAIN CHASSIS ASSEMBLY

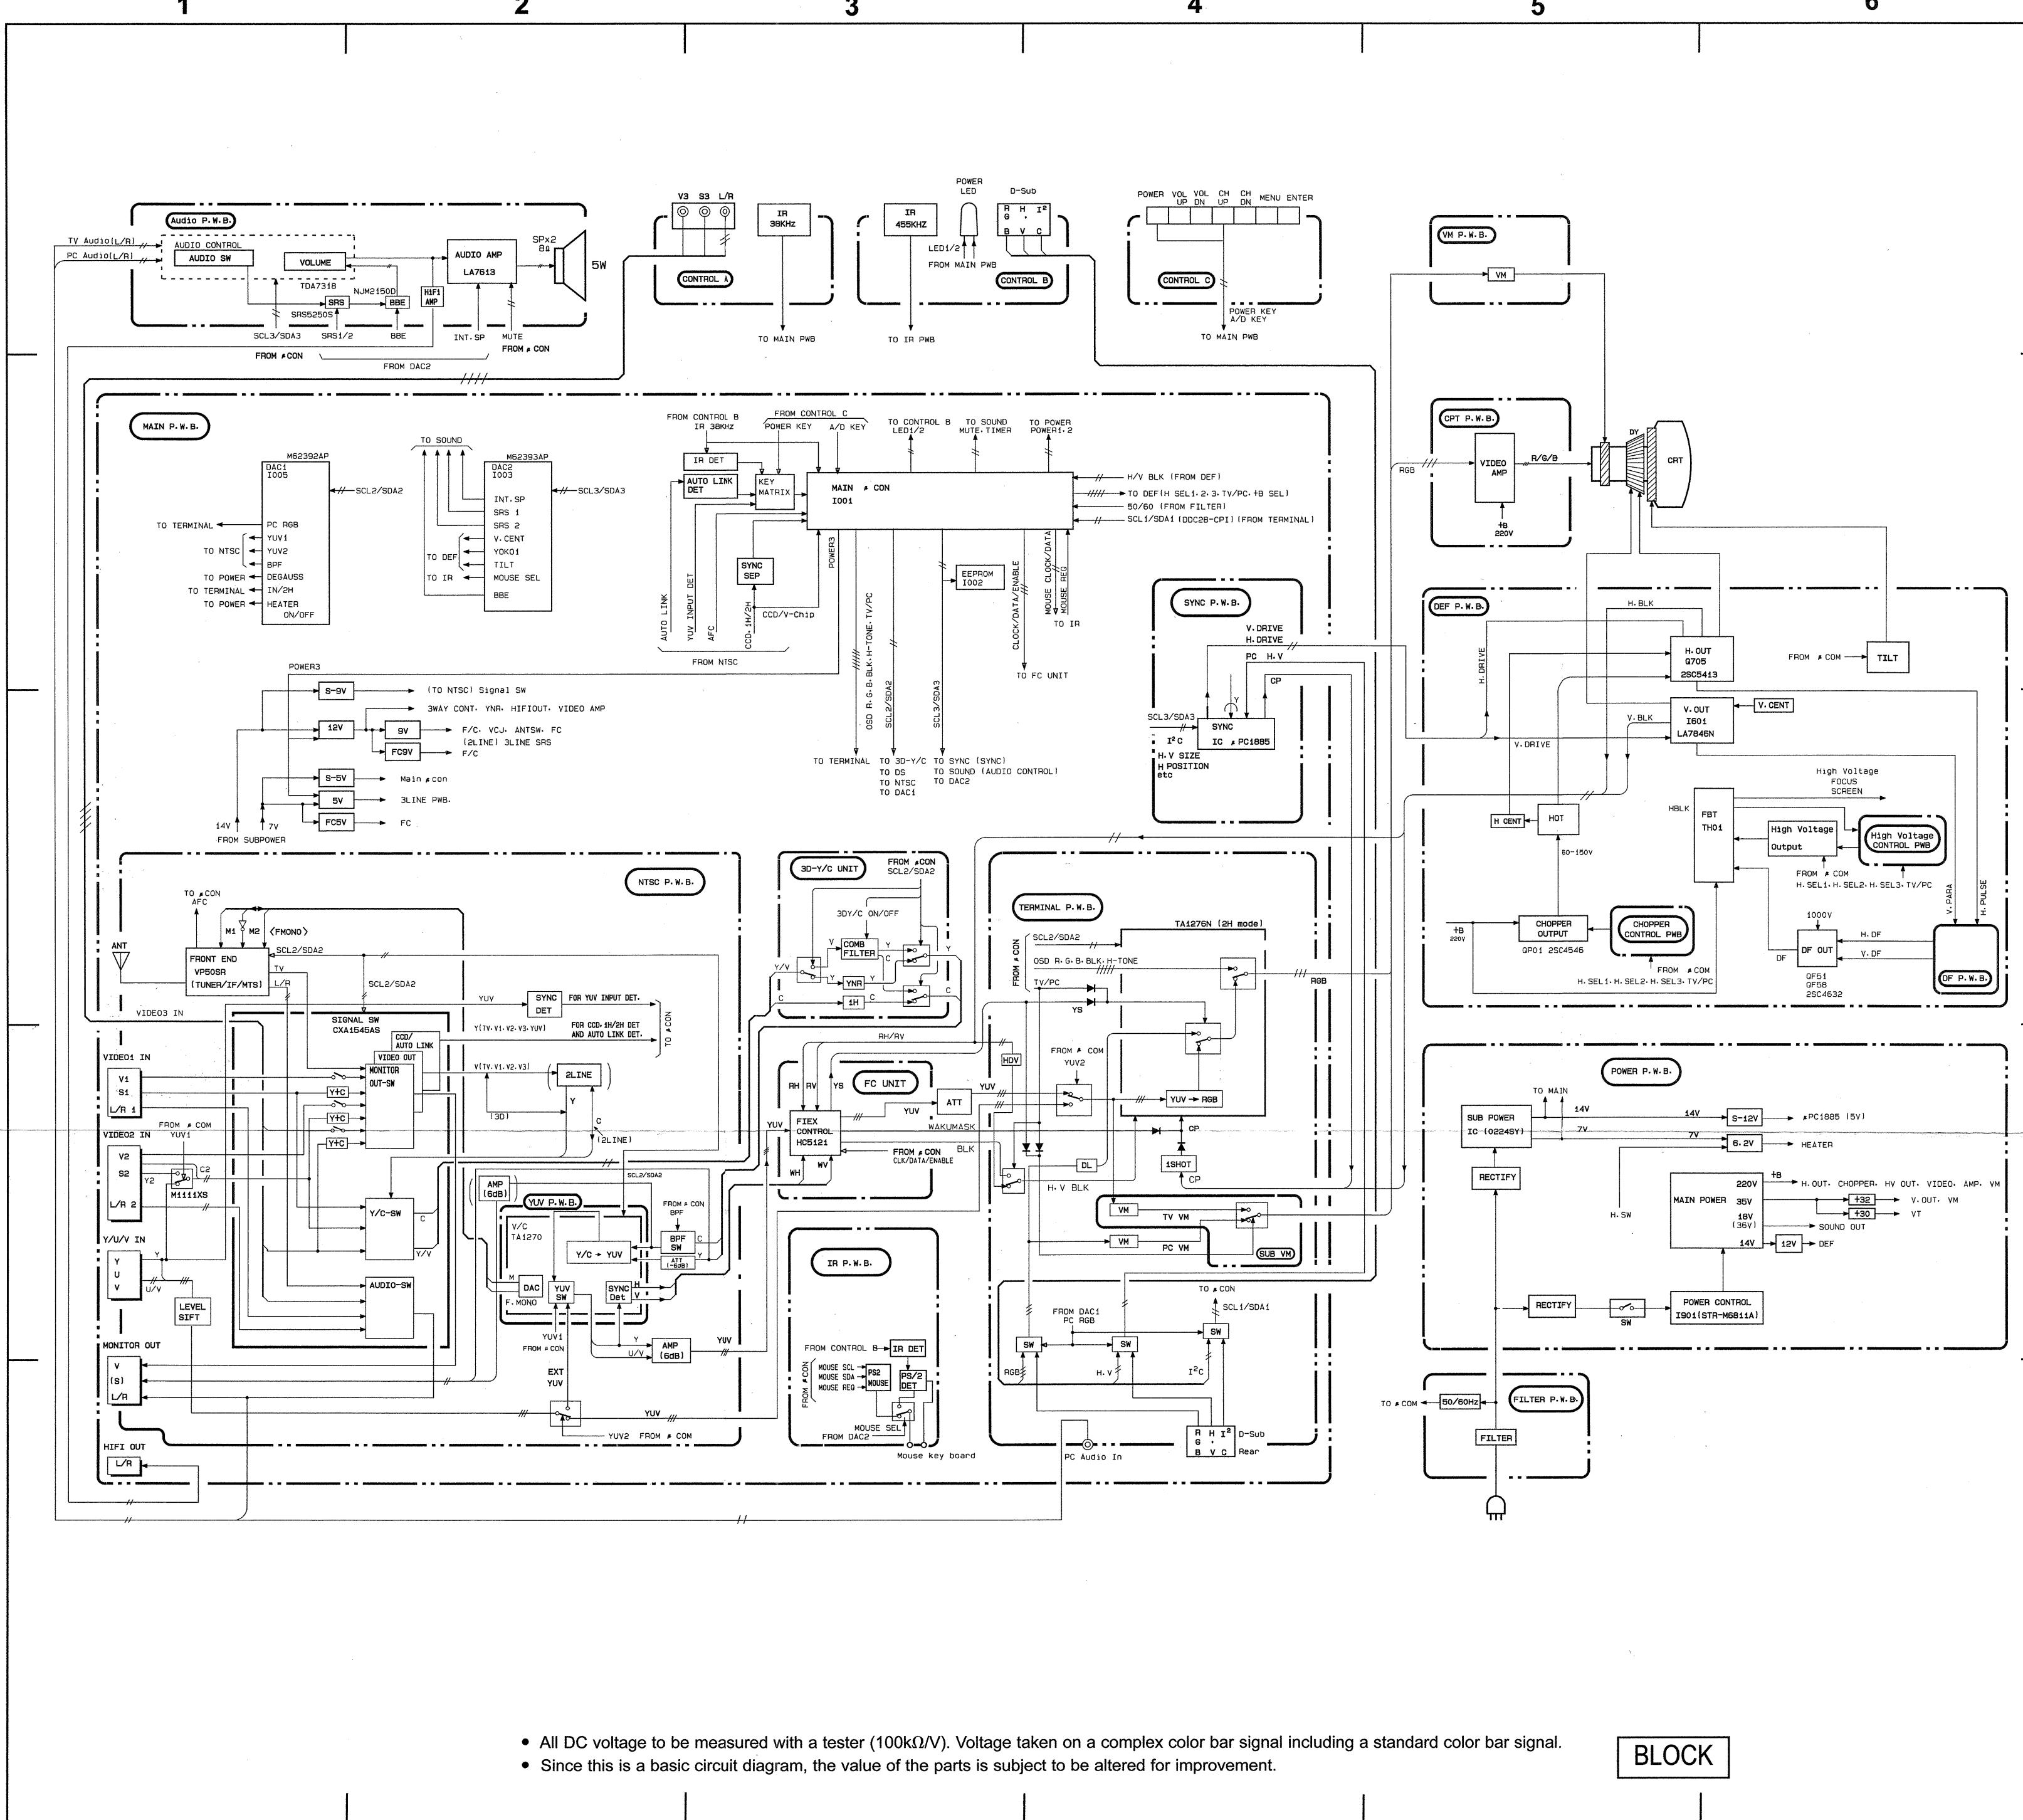

- All DC voltage to be measured with a tester ($100k\Omega/V$). Voltage taken on a complex color bar signal including a standard color bar signal.
 - Since this is a basic circuit diagram, the value of the parts is subject to be altered for improvement.

WIRING

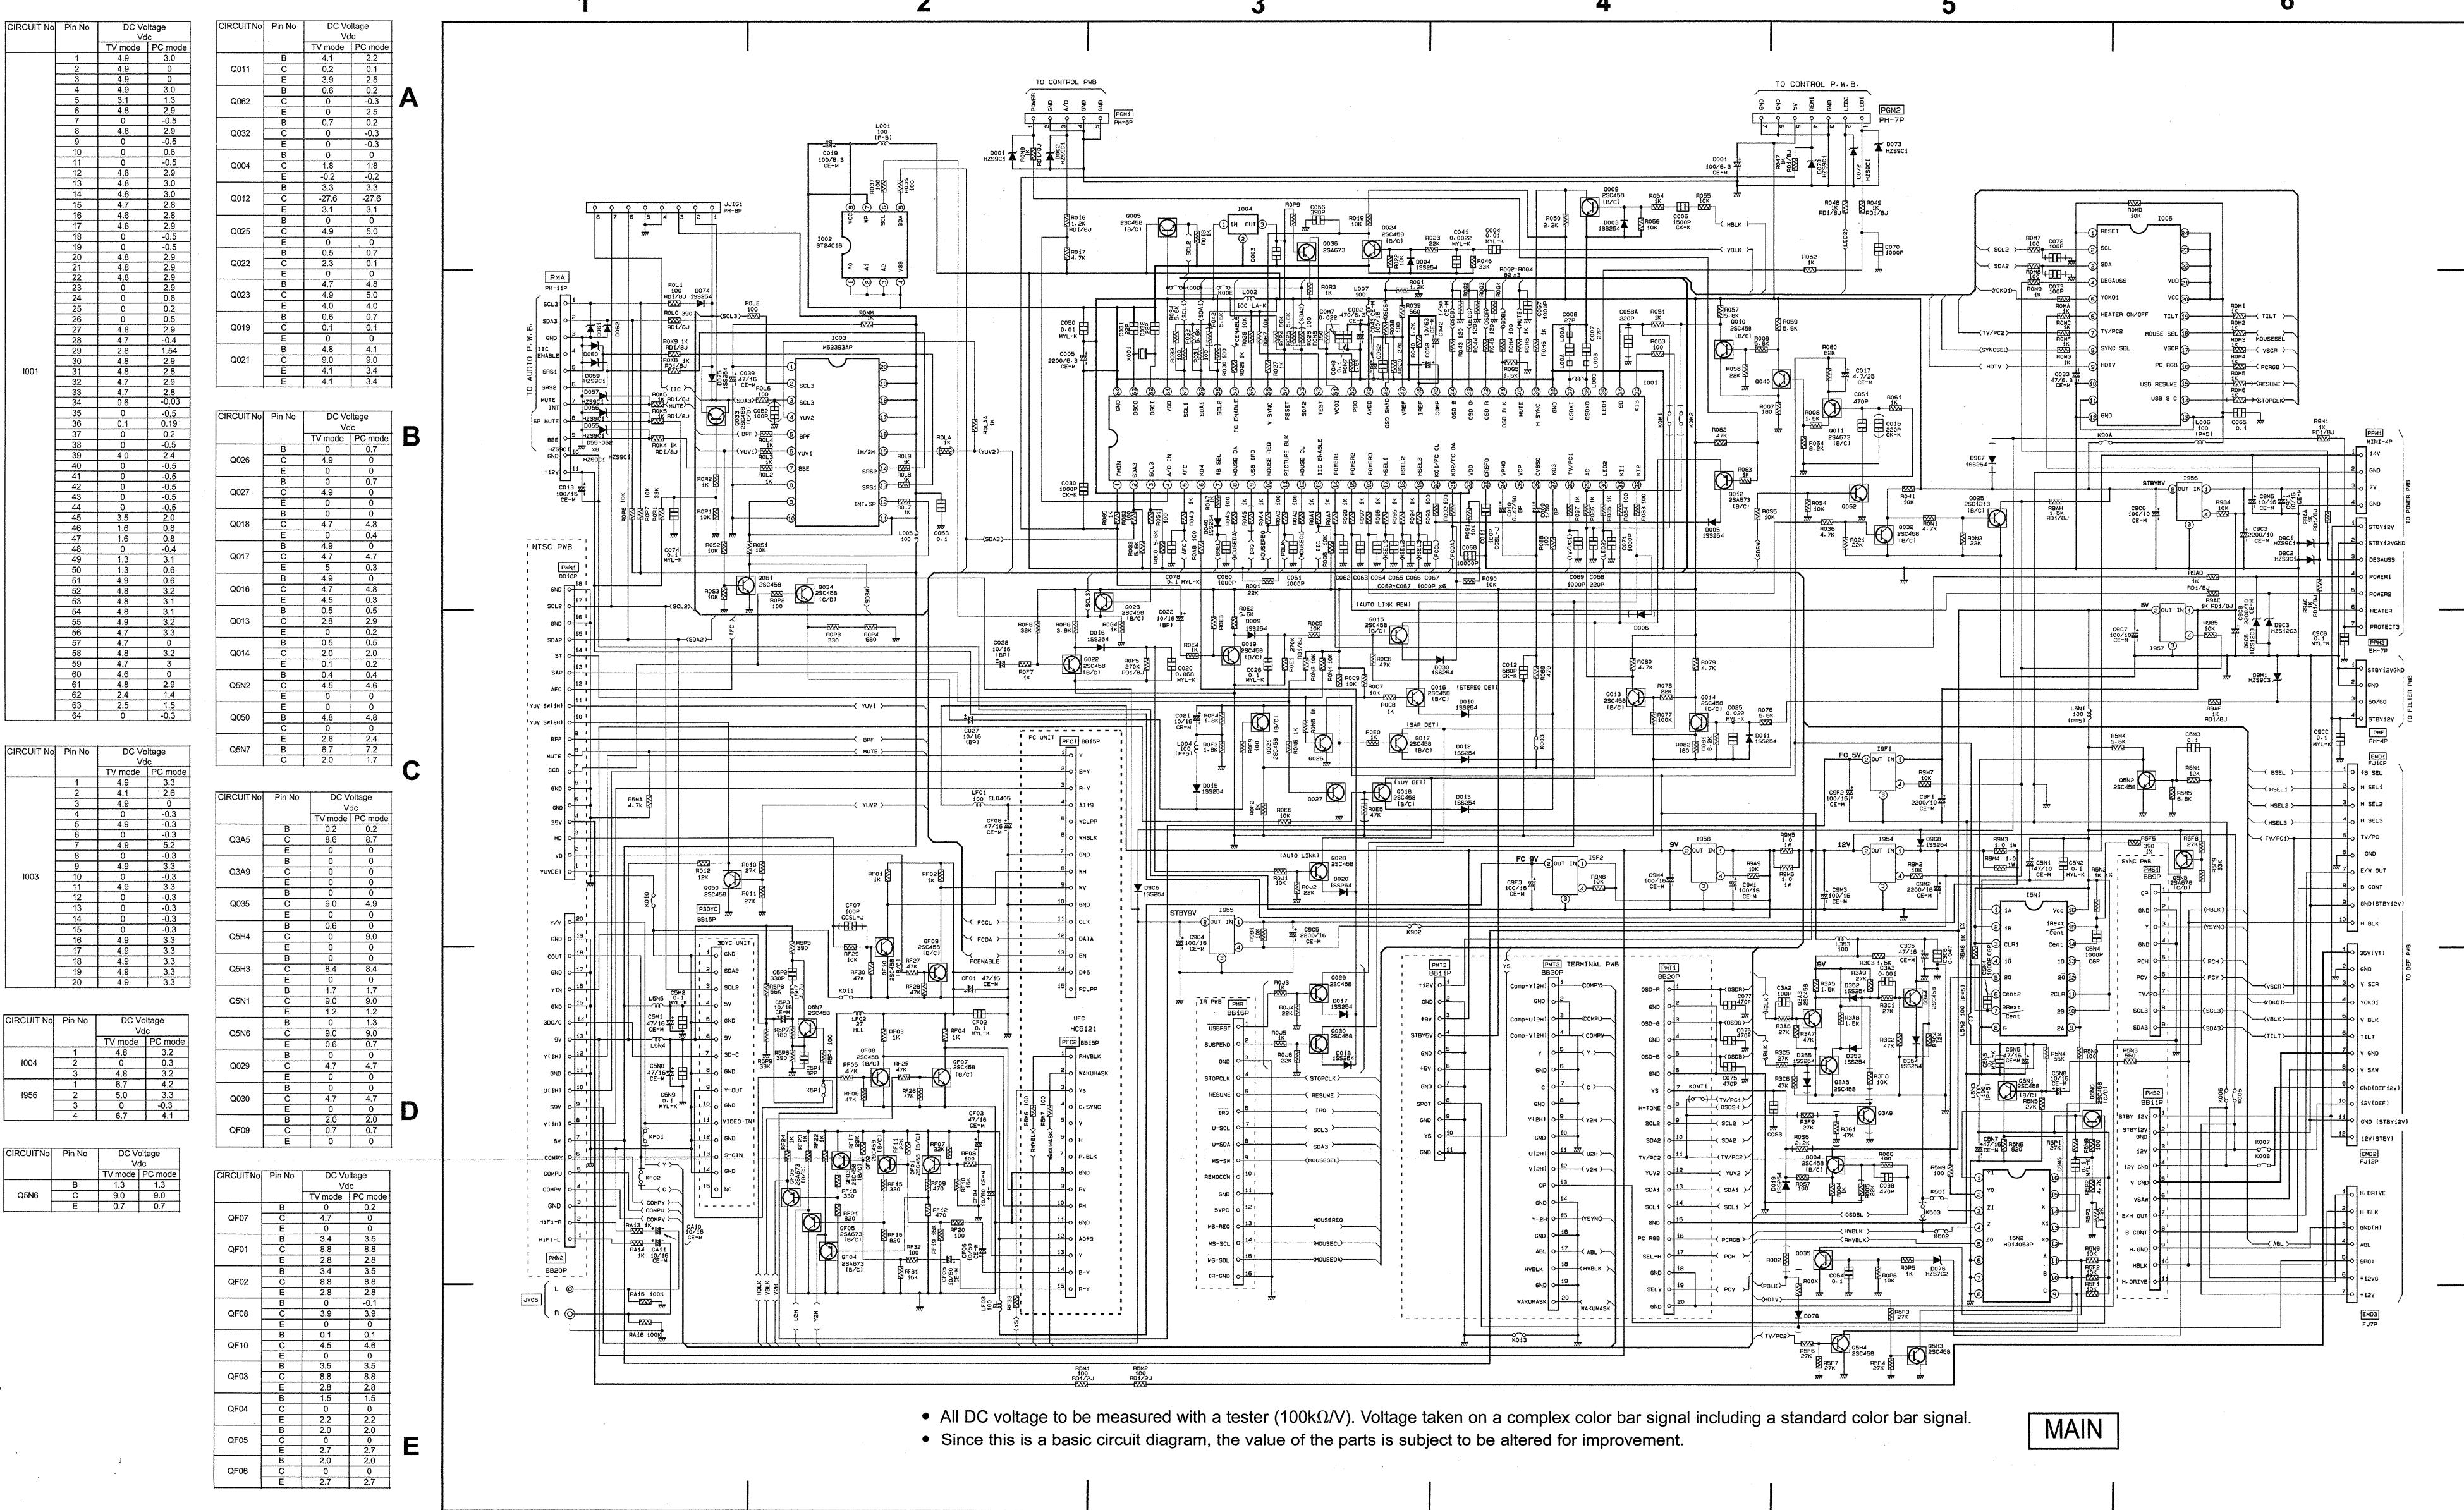

CHASSIS BLOCK DIAGRAM OF 36SDX88B/MM1

PRODUCT SAFETY NOTE: Components marked with a and shaded have special characteristics important to safety. Before replacing any of these components, read carefully the PRODUCT SAFETY NOTICE of this Service Manual. Don't degrade the safety of the receiver through improper servicing.

BLOCK

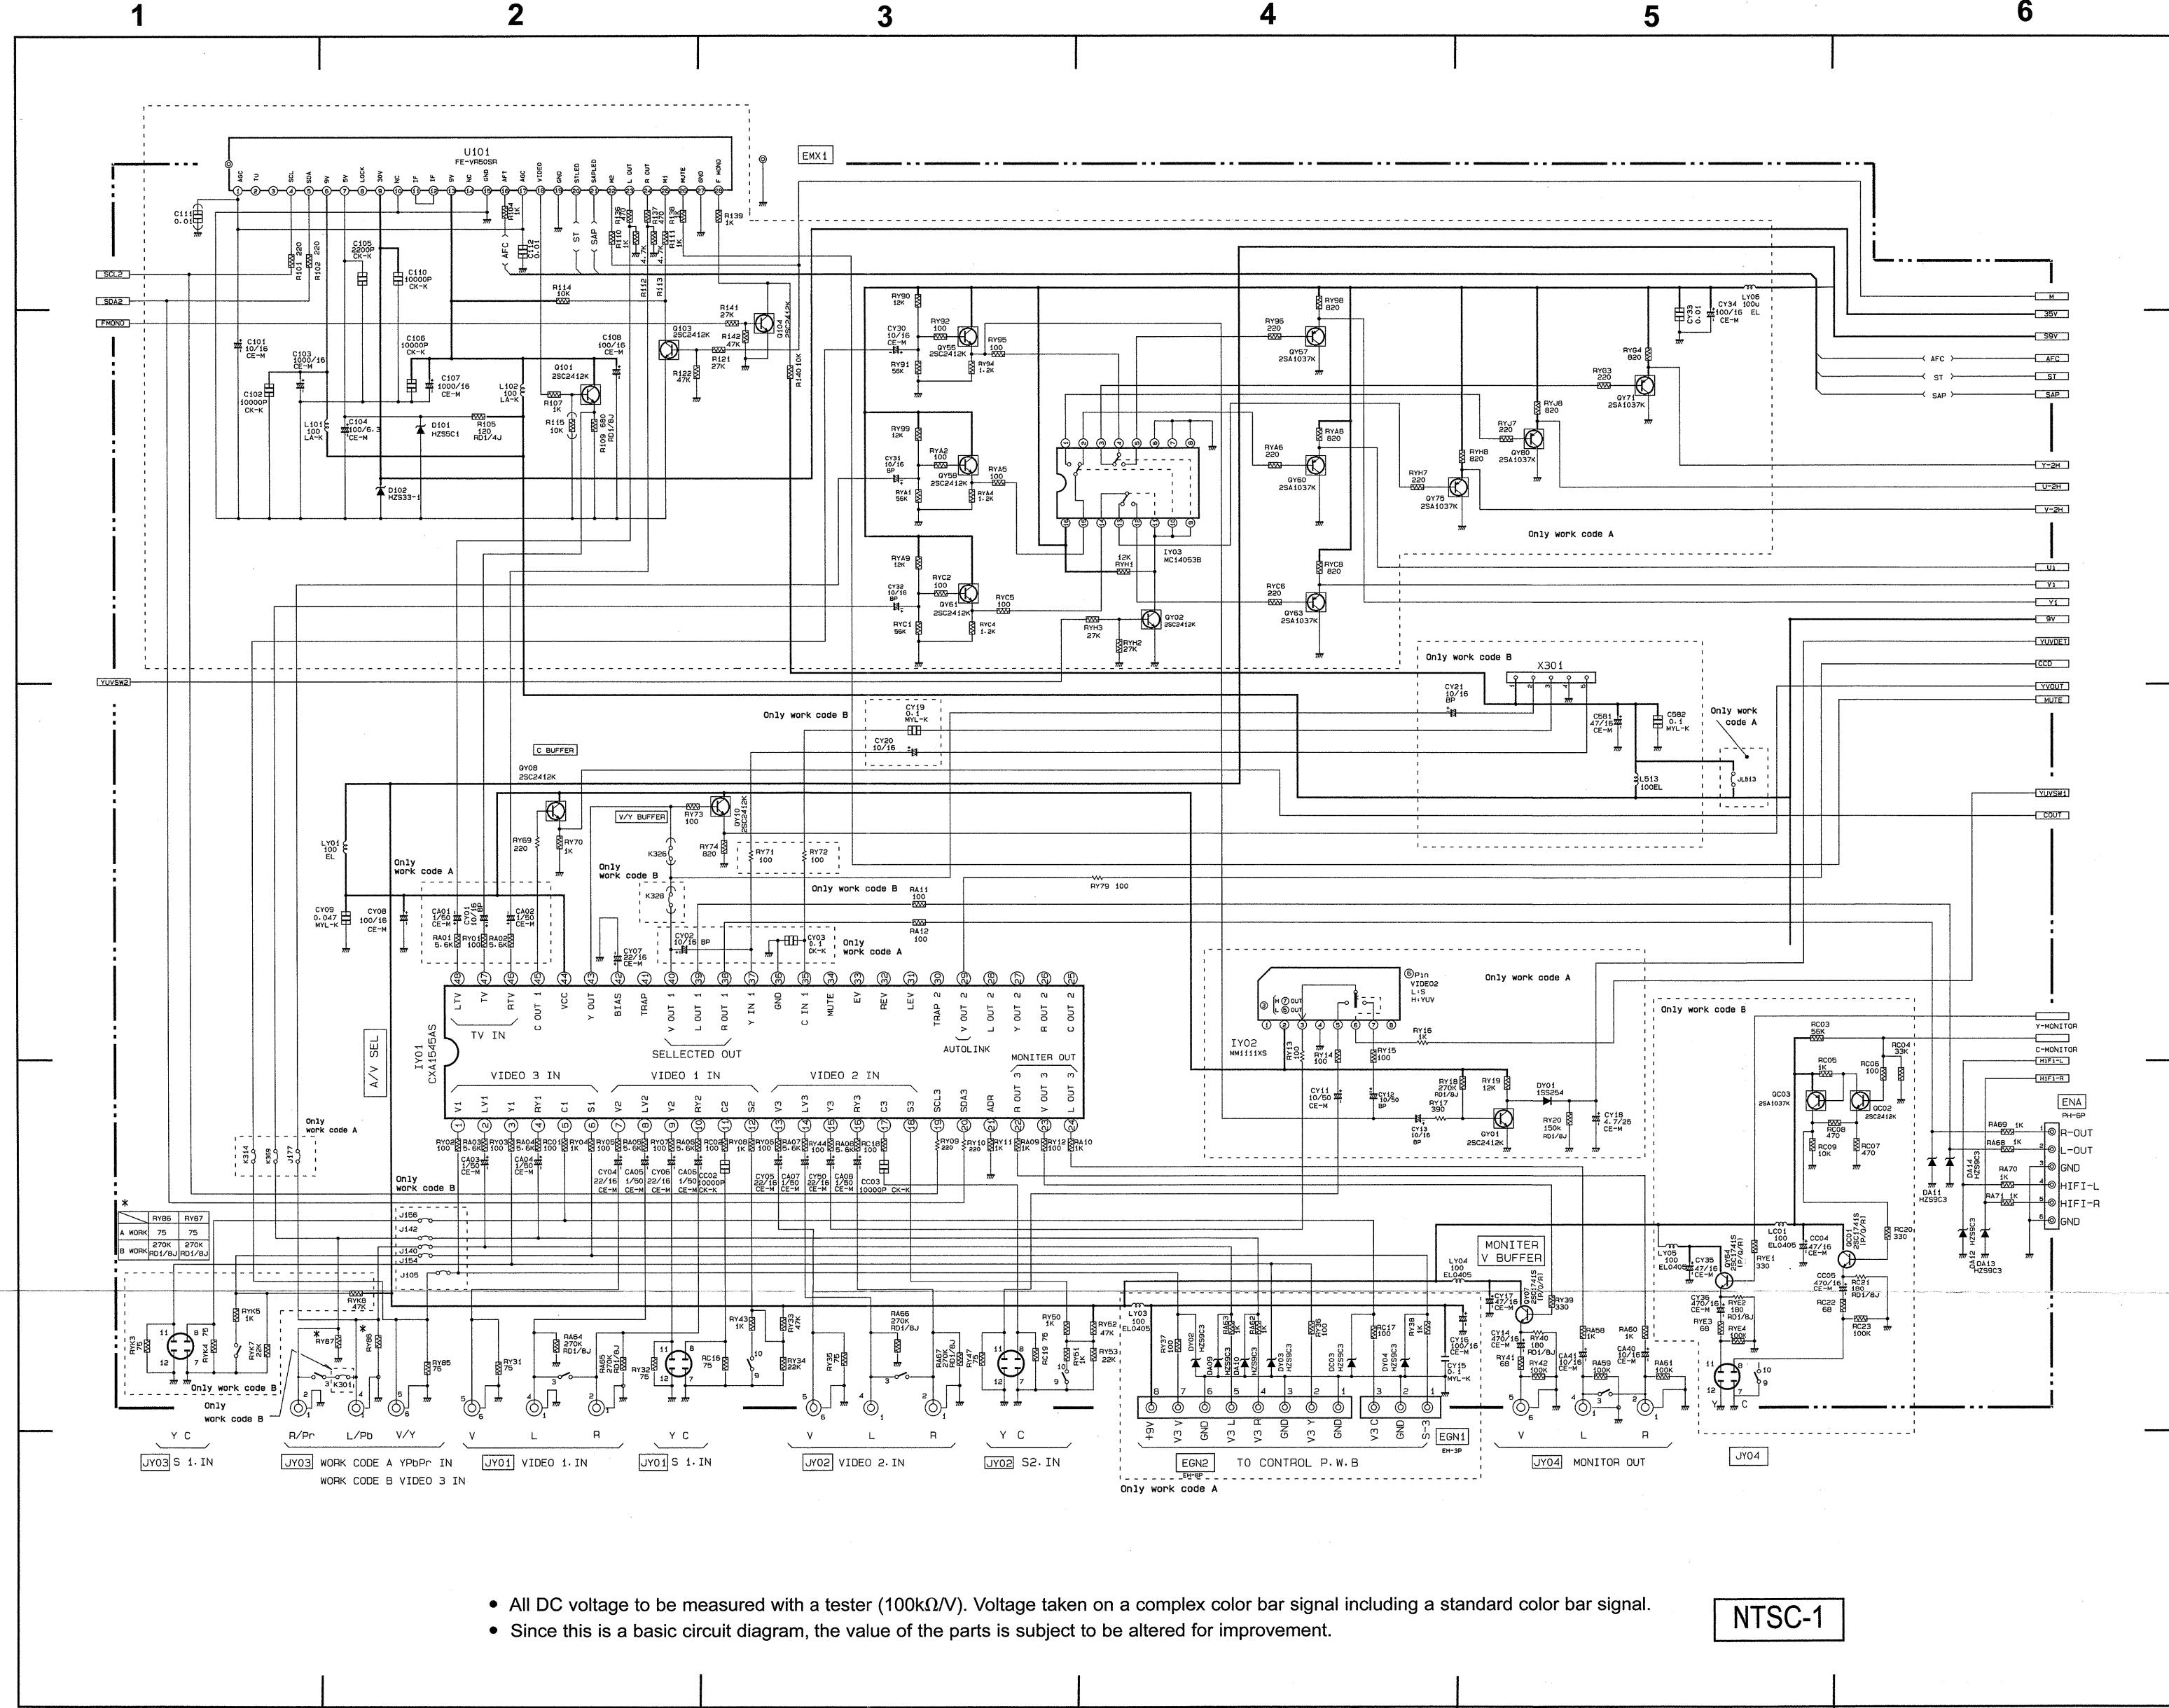

- All DC voltage to be measured with a tester (100kΩ/V). Voltage taken on a complex color bar signal including a standard color bar signal.
- Since this is a basic circuit diagram, the value of the parts is subject to be altered for improvement.

- All DC voltage to be measured with a tester (100kΩ/V). Voltage taken on a complex color bar signal including a standard color bar signal.
- Since this is a basic circuit diagram, the value of the parts is subject to be altered for improvement.

QL16	C	11.9
	E	6.5

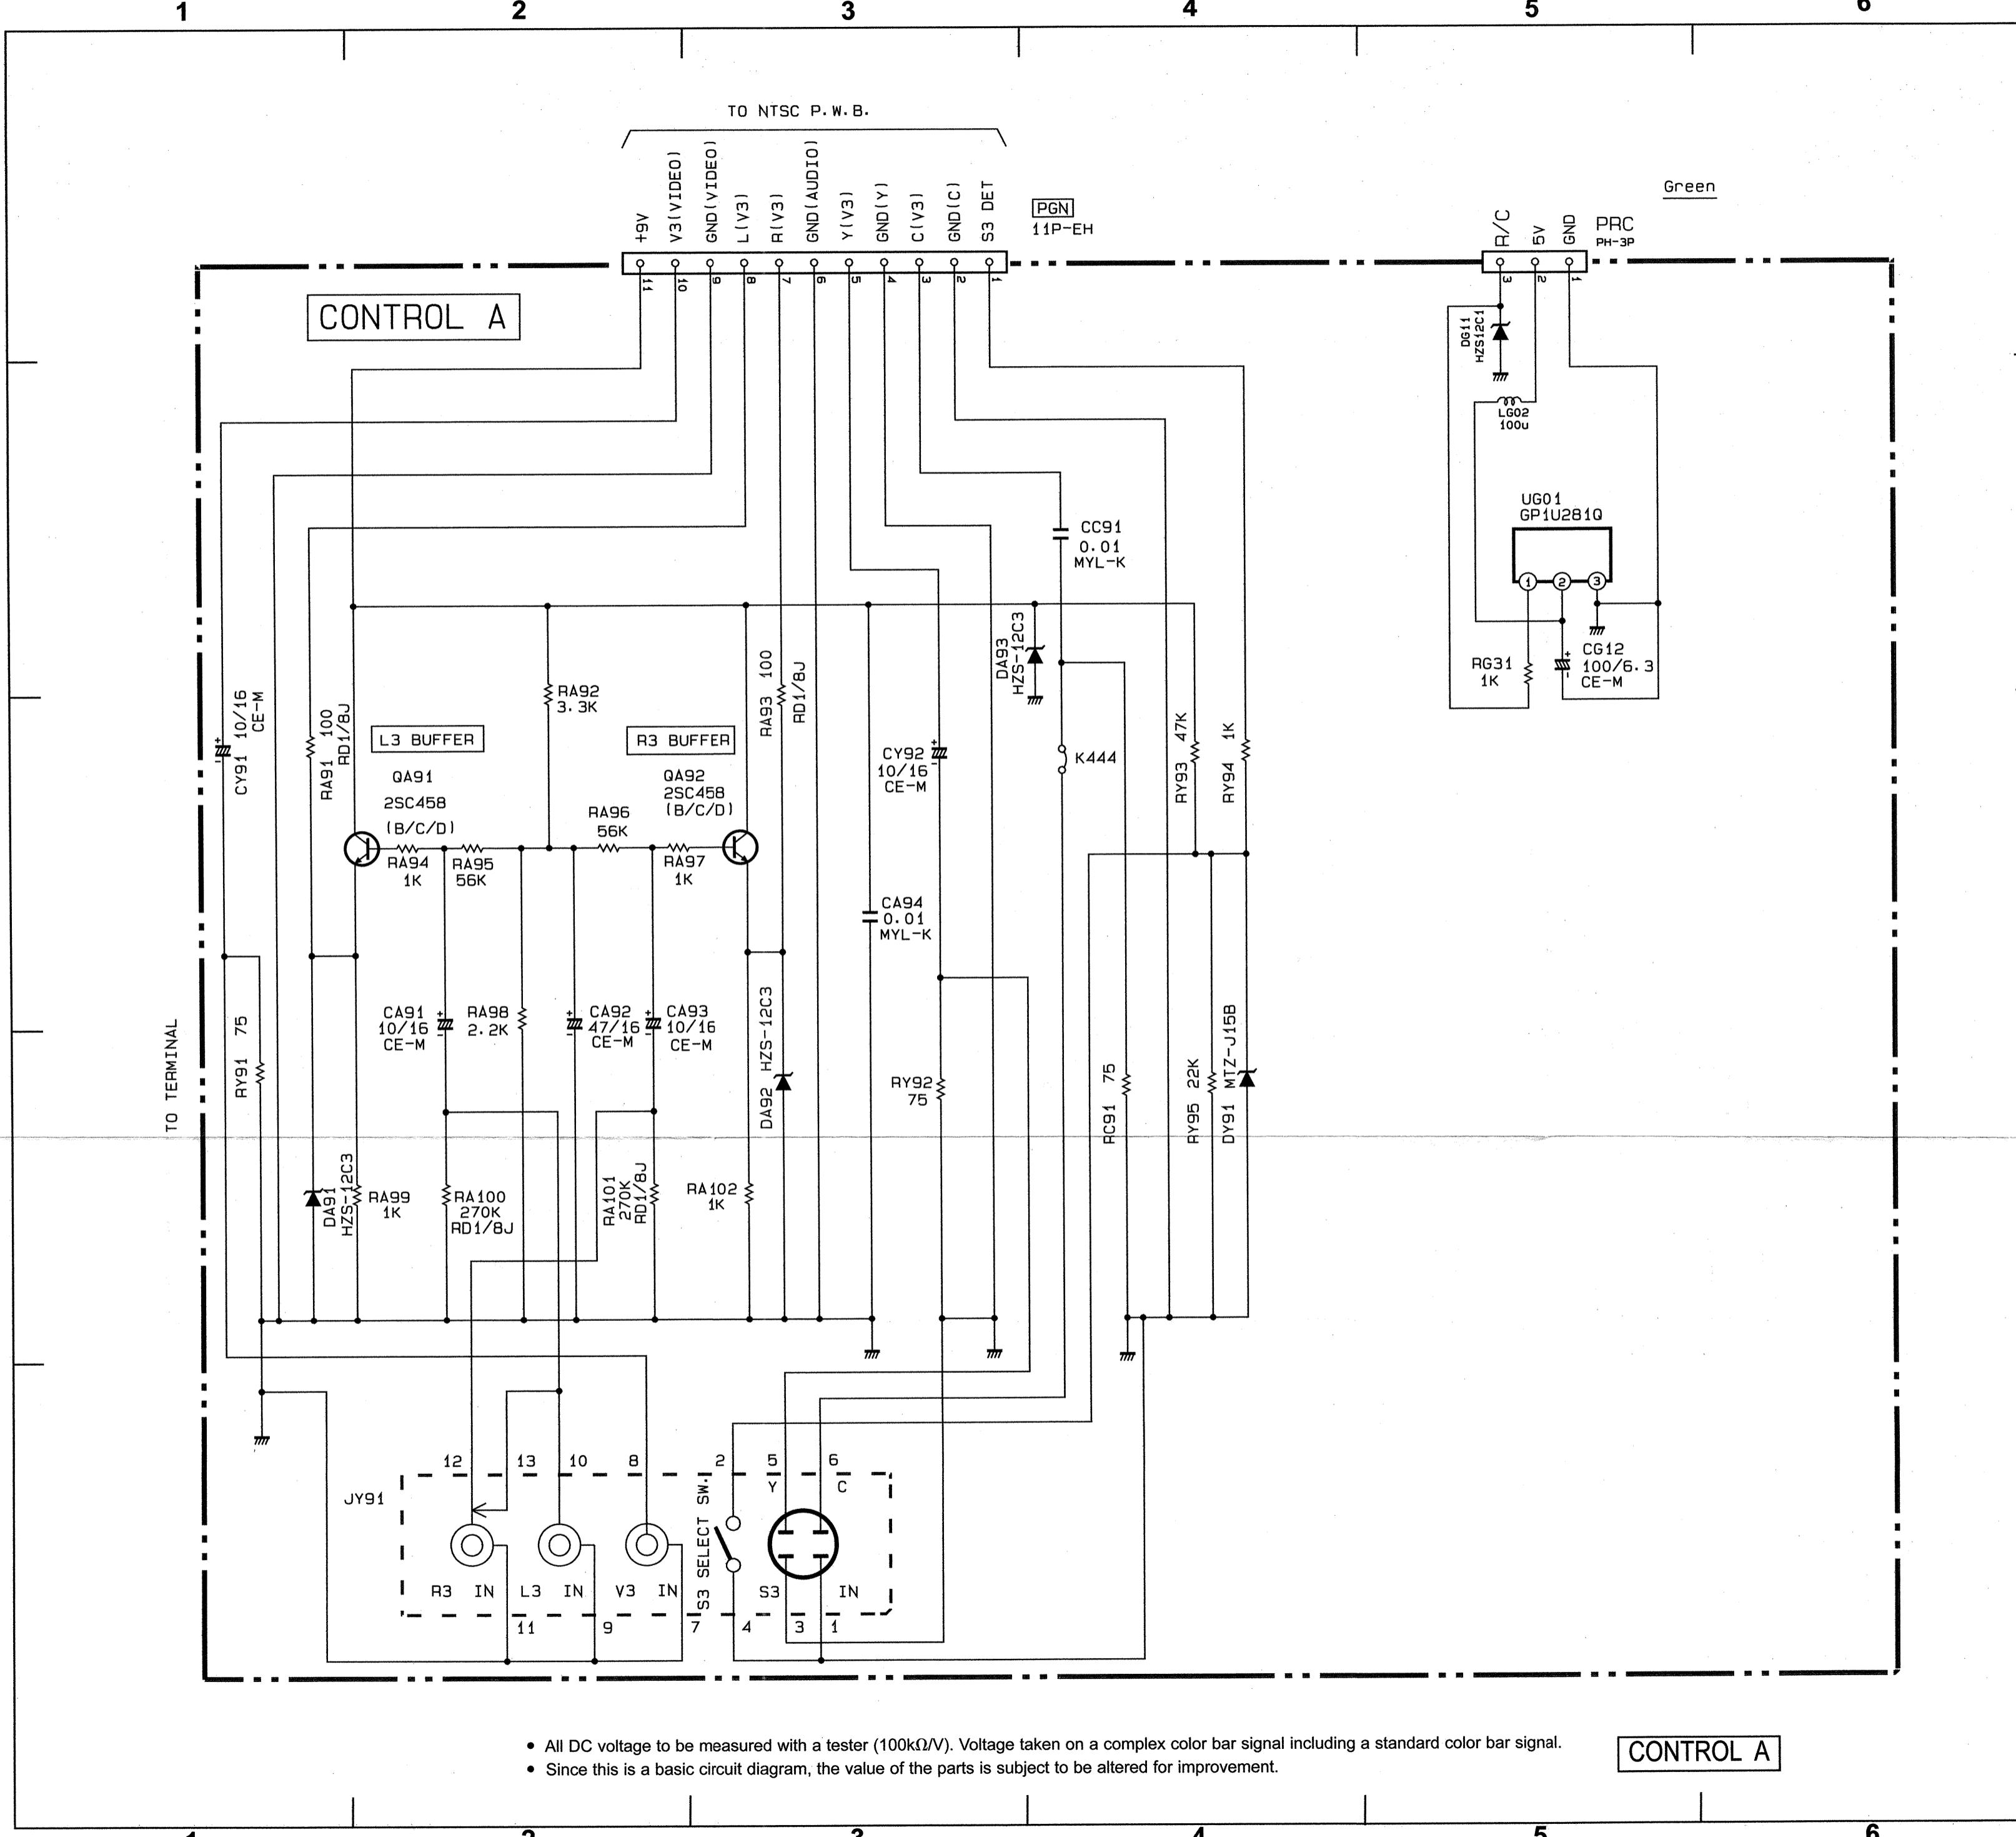

- All DC voltage to be measured with a tester ($100k\Omega/V$). Voltage taken on a complex color bar signal including a standard color bar signal.
- Since this is a basic circuit diagram, the value of the parts is subject to be altered for improvement.
